ARE CANADIAN KIDS TOO TIRED TO MOVE?
The ParticipACTION Report Card on Physical Activity for Children and Youth is the most comprehensive assessment of child and youth physical activity in Canada. The Report Card synthesizes data from multiple sources, including the best available peer-reviewed research, to assign evidence-informed grades across 12 indicators. Over the years, the Report Card has been replicated in numerous cities, provinces and countries, where it has served as a blueprint for collecting and sharing knowledge about the physical activity of young people around the world.

This Report Card includes new Canadian 24-Hour Movement Guidelines for Children and Youth: An Integration of Physical Activity, Sedentary Behaviour, and Sleep – the first of their kind in the world – and, for the first time, assigns a Sleep grade.

ParticipACTION’s strategic partner, the Healthy Active Living and Obesity Research Group at the Children’s Hospital of Eastern Ontario Research Institute (HALO-CHEO), played a critical role in the research and development of the 2016 Report Card:

Production of the Report Card is possible through funding from:

Additional support is provided by provincial and territorial governments through the Interprovincial Sport and Recreation Council (ISRC).

The 2016 Report Card is available for reproduction provided the following copyright acknowledgement is included:

Information has been provided from The 2016 ParticipACTION Report Card on Physical Activity for Children and Youth with permission from ParticipACTION.

Please use the following citation:

The 2016 Report Card and a summary of its findings (the Highlight Report) are available online at www.participACTION.com/reportcard.

Help Us Do Our Job Better

The Report Card is based on the best available physical activity data (for the most part from the previous calendar year, and from earlier years where appropriate). If you have data that could inform future grades for one or more indicators, please contact ParticipACTION (info@participACTION.com).

Indicators & Grades

Grades are common to every report card. The 2016 Report Card assigns letter grades to 12 different indicators that are grouped into three categories (Figure 1): Strategies & Investments (Government, Non-Government), Settings & Sources of Influence (Family & Peers, School, Community & Environment), and the Daily Behaviours (Overall Physical Activity, Organized Sport & Physical Activity Participation, Active Play, Active Transportation, Sleep, Sedentary Behaviours).

Figure 1. Summary of the 2016 Report Card indicators.

Letter grades are based on an examination of current data for each indicator against a benchmark along with an assessment of trends over time, and the presence of disparities (e.g., age, gender, disability, ethnicity, socioeconomic status). Together, the indicators provide a complete and robust assessment of how we are doing as a country in promoting and facilitating physical activity among Canadian children and youth.

A child’s overall physical activity is linked to physical and mental health, maintenance of a healthy body weight, academic performance, motor skill development & physical literacy, among other benefits.
Why is Physical Activity Important?

For health benefits, it is recommended that children and youth get at least 60 minutes of moderate-to-vigorous-intensity physical activity (MVPA) every day. On at least three days of each week, physical activity should include muscle- and bone-strengthening activities. As the Report Card has shown year over year since 2011, very few children and youth in Canada meet this recommendation. This continues to push researchers to explore the importance of all movement behaviours in order to better understand the benefits of physical activity, and the health risks and consequences of physical inactivity.

An example of recent research that continues to highlight the health benefits of physical activity is an international study of more than 6,000 children from 12 different countries, including both developed and developing countries. This study showed that 9- to 11-year-olds who get at least 55 minutes of MVPA per day are less likely to have obesity than their less active peers. The study also reveals that the odds of having obesity increase substantially in both boys and girls for every 25-minute decrease in daily MVPA. Other recent research has reported similar results.

The benefits of physical activity for mental health also continue to be understood and recognized. Research shows a link between higher levels of physical activity in children and youth and lower levels of anxiety and depression. A recent study of older youth and adults from 15 countries in Europe reveals that as self-reported physical activity increases, levels of self-reported happiness also increase. As well, a positive link between physical activity and academic performance continues to be seen. Students in grades 4 to 6 from 18 schools in rural Nova Scotia who had lower levels of physical activity were more likely to have lower scores in mathematics and English language arts. See The Effect of Physical Activity and Sedentary Behaviour on Brain Health and Development on page 14 for a more detailed look at the importance of physical activity to brain health.

Clearly, as children and youth move more and more throughout the day, health benefits increase. Given the current low levels of physical activity in Canadian children and youth, thoughtful and consistent physical activity promotion efforts are needed. Where successful, these efforts will most likely be met with numerous physical and mental health benefits for our children and youth.
Canadian kids are inactive and they may be losing sleep over it.

If you think kids can get a little physical activity and then play video games into the wee hours, yet remain healthy, you’re in for a rude awakening. Emerging research, which spurred Canada to develop the world’s first 24-Hour Movement Guidelines, shows that physical activity, sedentary behaviour – and sleep – are closely interrelated.

Kids who are tired out from running around sleep better, and those who have slept well have more energy to run around. And society is starting to pay attention to the fact that the reverse is also true and troubling: kids aren’t moving enough to be tired, and they may also be too tired to move. A groundswell of interest in the connection between these behaviours is highlighting the fact that sleep deprivation is a problem in Canadian kids:

- Only 9% of Canadian kids aged 5 to 17 get the 60 minutes of heart-pumping activity they need each day. Only 24% of 5- to 17-year-olds meet the Canadian Sedentary Behaviour Guidelines recommendation of no more than 2 hours of recreational screen time per day.
- In recent decades, children’s sleep duration has decreased by about 30 to 60 minutes.
- Every hour kids spend in sedentary activities delays their bedtime by 3 minutes. And the average 5- to 17-year-old Canadian spends 8.5 hours being sedentary each day at least some of the time.
- 33% of Canadian children aged 5 to 13, and 45% of youth aged 14 to 17, have trouble falling asleep or staying asleep at least some of the time.
- 36% of 14- to 17-year-olds find it difficult to stay awake during the day at least sometimes.
- 31% of school-aged kids and 26% of adolescents in Canada are sleep-deprived.

Even kids who are meeting the minimum requirements for sleep duration are not necessarily getting good sleep. Increased screen time and packed schedules mean that kids are getting poor or inconsistent sleep – for instance, staying up late to do homework during the week, or watching TV in their bedrooms until midnight and then playing catch-up on the weekends.

- 43% of 16- to 17-year-old Canadians are not getting enough sleep on weekdays.

The perils of a sleep-deprived generation are not limited to kids being tired and cranky; they show their fatigue in different ways. Some effects of sleep deprivation in kids are obvious and some are not so obvious:

- Too little sleep can cause hyperactivity, impulsiveness and a short attention span.
- Children with reduced sleep are more likely to struggle with verbal creativity and problem solving, and generally score lower on IQ tests.
- A short sleep duration produces adverse hormonal changes like those associated with increased risks of obesity, diabetes and hypertension.
Chronic sleep loss is linked to higher rates of depression and suicidal thoughts.²²,²³

And it’s a vicious cycle: a study of Toronto kids aged 10 to 12 years showed that those who slept the least on school nights were significantly less active and more sedentary than those who slept the most.²⁴

The good news is that regular, heart-pumping physical activity might just be the best sleep aid there is:

- **Grade 5 students** with higher physical activity levels are less likely to be sleepy during the daytime.²⁵
- **Active transportation** (e.g., walking or biking) and outdoor play increase exposure to sunlight, which helps regulate sleep patterns.¹⁸
- **Physical activity** helps kids fall asleep faster.²⁶
- **High school students** who get at least 60 minutes of physical activity each day are 41% more likely to get sufficient sleep than those who don’t.²⁷

Our tendency may be to cram more into each day to wear kids out, but more activities don’t necessarily equal more physical activity. Plus, overscheduling can impact sleep by getting kids excited and pushing back dinnertime, homework time and bedtime.²⁸ As stated in the new **Canadian 24-Hour Movement Guidelines for Children and Youth** (page 9), a healthy childhood requires a balance of physical activity, sedentary behaviour and sleep. The health benefits that come with heart-pumping physical activity are reduced if children have poor sleep habits or engage in excessive sedentary behaviour. And well-rested children are not healthy if they are not getting enough activity.

To stem the creeping “sleepidemic,” kids need to get off the couch, get outdoors and get their hearts pumping regularly. It’s time for a wake-up call. **If Canadian kids sit less and move more, we will all sleep better.**
PREAMBLE

These guidelines are relevant to apparently healthy children and youth (aged 5–17 years) irrespective of gender, race, ethnicity, or the socio-economic status of the family. Children and youth are encouraged to live an active lifestyle with a daily balance of sleep, sedentary behaviours, and physical activities that supports their healthy development.

Children and youth should practice healthy sleep hygiene (habits and practices that are conducive to sleeping well), limit sedentary behaviours (especially screen time), and participate in a range of physical activities in a variety of environments (e.g., home/school/community; indoors/outdoors; land/water; summer/winter) and contexts (e.g., play, recreation, sport, active transportation, hobbies, and chores).

For those not currently meeting these 24-hour movement guidelines, a progressive adjustment toward them is recommended. Following these guidelines is associated with better body composition, cardiorespiratory and musculoskeletal fitness, academic achievement and cognition, emotional regulation, pro-social behaviours, cardiovascular and metabolic health, and overall quality of life. The benefits of following these guidelines far exceed potential risks.

These guidelines may be appropriate for children and youth with a disability or medical condition; however, a health professional should be consulted for additional guidance.

The specific guidelines and more details on the background research informing them, their interpretation, guidance on how to achieve them, and recommendations for research and surveillance are available at www.csep.ca/guidelines.
GUIDELINES

For optimal health benefits, children and youth (aged 5–17 years) should achieve high levels of physical activity, low levels of sedentary behaviour, and sufficient sleep each day.

A healthy 24 hours includes:

**SWEAT**

MODERATE TO VIGOROUS PHYSICAL ACTIVITY
An accumulation of at least 60 minutes per day of moderate to vigorous physical activity involving a variety of aerobic activities. Vigorous physical activities, and muscle and bone strengthening activities should each be incorporated at least 3 days per week;

**STEP**

LIGHT PHYSICAL ACTIVITY
Several hours of a variety of structured and unstructured light physical activities;

**SLEEP**

Uninterrupted 9 to 11 hours of sleep per night for those aged 5–13 years and 8 to 10 hours per night for those aged 14–17 years, with consistent bed and wake-up times;

**SIT**

SEDENTARY BEHAVIOUR
No more than 2 hours per day of recreational screen time; Limited sitting for extended periods.

Preserving sufficient sleep, trading indoor time for outdoor time, and replacing sedentary behaviours and light physical activity with additional moderate to vigorous physical activity can provide greater health benefits.
INDICATORS: Daily Behaviours

9% of 5- to 17-year-olds accumulate at least 60 minutes of moderate- to vigorous-intensity physical activity per day.

2012-13 CHMS
Overall Physical Activity

This year’s grade remains a D- for the fourth year in a row. The grade reflects the balance between one age group that is doing well (3- to 4-year-olds) and two age groups that are doing poorly (5- to 11-year-olds and 12- to 17-year-olds). Most school-aged children and youth in Canada are not meeting the moderate- to vigorous-intensity physical activity (MVPA) recommendation within the Canadian 24-Hour Movement Guidelines for Children and Youth. Conversely, most preschool-aged children in Canada (3- to 4-year-olds) are meeting the physical activity recommendations for this age group, which recommend 180 minutes of daily activity at any intensity.

- **Percentage of children and youth** who meet the MVPA recommendation within the Canadian 24-Hour Movement Guidelines for Children and Youth (at least 60 minutes of daily MVPA).

- **Percentage of preschoolers** who meet the Canadian Physical Activity Guidelines for the Early Years (at least 180 minutes of physical activity at any intensity every day).
Key Findings

- **Approximately 7% of 5- to 19-year-olds** in Canada take at least 12,000 steps on every day of the week, which approximates the physical activity recommendations in the *Canadian 24-Hour Movement Guidelines for Children and Youth*, which recommend at least 60 minutes of MVPA per day (2012-14 Canadian Physical Activity Levels Among Youth study [CANPLAY], Canadian Fitness and Lifestyle Research Institute [CFLRI]).

- **20% of 11- to 15-year-olds** in Canada report at least 60 minutes of MVPA on all seven days of the week (2013-14 Health Behaviour in School-Aged Children [HBSC]).

- **8% of 8- to 12-year-olds** in Canada take at least 12,000 steps on every day of the week, which approximates the physical activity recommendations in the *Canadian 24-Hour Movement Guidelines for Children and Youth* (2011-16 Canadian Assessment of Physical Literacy, Healthy Active Living and Obesity Research Group). Among this sample of children, 31% report at least 60 minutes of MVPA on all seven days of the week.

- **70% of 3- to 4-year-olds** meet the daily recommendation of at least 180 minutes of physical activity at any intensity (2012-13 Canadian Health Measures Survey [CHMS], Statistics Canada).

- **9% of 5- to 17-year-olds** (14% of 5- to 11-year-olds and 5% of 12- to 17-year-olds) accumulate at least 60 minutes of MVPA (2012-13 CHMS, Statistics Canada) on at least six days of the week. This percentage has remained stable since the 2007-09 CHMS, when 7% of 5- to 17-year-olds met the daily recommendation.29

- **65% of 12- to 17-year-old First Nations youth** in on-reserve and northern communities in Canada report a daily average of at least 60 minutes of MVPA (2008-10 First Nations Regional Health Survey).30

**Note:** These findings should be interpreted with caution due to the self-report nature of the data. As suggested by the authors of the study, “Until [physical activity] is measured objectively in [First Nations] youth, true levels of daily [physical activity] will remain uncertain.”30

Research Gaps

- **More research is needed** to determine what impact there will be on behaviours of children and youth as the move is made to implement the 24-hour integrated movement guidelines.

- **Interventions that will increase physical activity** among children and youth need to be both effective and sustainable. Research is needed to ascertain which interventions would be most appropriate.

- **Surveillance** and national-level descriptive data based on adherence to the new 24-Hour Movement Guidelines are needed.

Recommendations

- **Widely disseminate** the new 24-Hour Movement Guidelines, and provide support for their implementation in different sectors and settings.

- **Support children and youth** in adding bouts of physical activity throughout their day – before, during and after school; in the evenings; and on the weekend. The majority of Canadian children and youth still need to make important changes in their routine physical activity patterns.

- **Remove barriers** for low-income families by ensuring there are simple and dignified ways to access programs (e.g., no proof of income needed, decrease in complicated paperwork).
Overall Physical Activity

Literature Synthesis

The data that inform the grade for this indicator relate to preschoolers and school-aged children. Research is also becoming available on the proportion of toddlers who meet the Canadian Physical Activity Guidelines for the Early Years, which recommend at least 180 minutes per day of physical activity at any intensity. In one small study in Toronto, 23% of toddlers (< 18 months of age) met the recommendations.1 Two other recent studies in Ontario and Alberta found that toddlers are getting very little MVPA: less than five minutes per waking hour.2,3 In one of these studies,4 MVPA was between one and four minutes per waking hour depending on the accelerometer cut-point or rule used to classify their movement. While one cut-point might classify movement within a 15-second period as light-intensity physical activity, another cut-point might classify the same movement as sedentary behaviour. This highlights one of the current challenges when measuring physical activity in children and youth.

The Effect of Physical Activity and Sedentary Behaviour on Brain Health and Development

Emerging research highlights the importance of physical activity for healthy brain development, which can lead to improved learning and academic outcomes. For example, researchers have shown that children who are physically active for as little as 20 minutes daily have more active brains,5 better standardized test scores,6 and improved attention in the classroom.7 Additionally, grades 2 and 3 students who participated in math and spelling lessons that involved physical activity for two years made greater gains in mathematics and spelling compared to their peers who did not participate in physically active academic lessons.8 Preliminary evidence also suggests that physical activity may benefit cognitive development in early childhood (birth to 5 years of age).9 As well, researchers are beginning to recognize that excessive sedentary time negatively influences brain health and may even counteract the benefits of activity.10 Preliminary evidence from a recent systematic review suggests that reading is beneficial to cognitive development in early childhood (birth to 5 years of age), while screen time is not beneficial and may even be detrimental.11 These findings stress the importance of sufficient physical activity and limited sedentary time for healthy brain development.
Overall Physical Activity

Physical Activity and Children/Youth Living with Disabilities

Research generally shows that children and youth with disabilities participate in recreational and leisure activities at lower rates than their peers without disabilities, and that these participation rates are lower with increasing age. A study of children with autism spectrum disorder, for example, found that only 12% were physically active, pursuing mostly solitary forms of play. However, in a recent study of preschoolers with congenital heart disease, their physical activity levels were comparable to preschoolers without cardiac disease. Physical activity programs and opportunities tailored to the age and specific needs/preferences of children and youth with disabilities are needed.

In 2015, the Canadian Disability Participation Project released the Physical Activity, Active Living, and Sport Resource Catalogue, which provides online resources for Canadians living with disabilities. The catalogue is intended to be a living document where people and organizations can submit resources. The catalogue can be downloaded at cdpp.ca/resources-and-publications/physical-activity-active-living-and-sport-resource-catalogue. To learn how to have a resource added to the catalogue, please contact Robert Shaw (shawrb@mcmaster.ca).

Contributing Factors and Disparities

The CANPLAY study reveals that age- and gender-related disparities in physical activity among Canadian children and youth have not disappeared over the past eight years. From 2014 to 2015, average daily steps decreased with increasing age (12,303 steps per day in 5- to 10-year-olds vs. 10,762 steps per day in 11- to 14-year-olds vs. 9,667 steps per day in 15- to 19-year-olds). The difference between the younger and older age groups has been consistent year over year since the CANPLAY study began in 2005.

When considering gender-related disparities, a similar trend is evident. Boys generally take more daily steps than girls. From 2014 to 2015, boys took an average of 11,862 steps per day vs. 10,536 steps per day for girls (Figure 3). A national study by Statistics Canada lends further evidence to this gender disparity: in 5- to 17-year-olds in Canada, 13% of boys vs. 6% of girls get at least 60 minutes of daily MVPA on average. This disparity is also seen abroad. An international study of almost 30,000 children and youth from 10 different countries found that boys are more physically active at all ages.

![Figure 3. Proportion of 5- to 19-year-olds in Canada with daily step counts that approximate the Canadian Physical Activity Guidelines, which recommend at least 60 minutes of MVPA per day, by year and gender (source: 2005-15 CANPLAY, CFLRI).]
Organized Sport & Physical Activity Participation

This year’s grade is a slight improvement over last year’s grade due to new data that show an increase in sport participation by several percentage points, and which is significantly higher than the participation rate 10 years earlier.

- **Percentage of children and youth** who participate in organized sport and/or physical activity programs.
Key Findings

- **76% of 11- to 15-year-olds** in Canada report that they currently participate in organized sports (2013-14 HBSC).
- **According to parents**, 77% of 5- to 19-year-olds in Canada participate in organized physical activities or sports (2014-15 CANPLAY, CFLRI). Participation rates in organized physical activities or sports are slightly higher compared to the earliest years of the CANPLAY study (2005 to 2007).
- **According to parents**, 47% of 5- to 19-year-olds in Canada participate in organized physical activities or sports during the afterschool period (2014-15 CANPLAY, CFLRI).
- **75% of families** that have a child with a disability report that their child participates in organized sports (2014 CIBC – KidSport™ Report, CIBC and KidSport™).
- **Just under 30% of 3- to 21-year-olds** in Canada with severe developmental disabilities (e.g., moderate to severe intellectual disabilities, autism spectrum disorders, dual diagnosis, physical disabilities, genetic syndromes) play team sports.51

Research Gaps

- **Evidence suggests** that children and youth generally take 2 to 4 weeks to recover from sport-related concussions.52 Youth appear to require more time to become symptom free than do children.52 More research is needed on how to manage sport-related concussions in children and youth in order to facilitate complete recovery.53
- **More effective monitoring** of sport participation, across all levels of performance, is needed in Canadian children and youth.
- **There is a need to better understand** the physical activity participation of children with disabilities. The participation rates appear to be quite high, but this does not mean these children are doing the same volume as kids without disabilities.

Recommendations

- **Educate parents, coaches, officials and participants** on the principles of fair play according to the True Sport Principles (www.truesportpur.ca/true-sport-principles) and Canadian Sport 4 Life (www.canadiansportforlife.ca).
- **Encourage program providers** to develop strategies to counter the dropout rate in organized sport and physical activities among youth.
- **Encourage program providers** to make the development of physical literacy a priority within their program.
Research continues to show many associated benefits with participation in organized sports. In a Montreal-based study that tracked youth sport participation throughout secondary school, those who consistently reported participating in school sports were more likely to report lower levels of depression and perceived stress, and higher self-rated mental health in early adulthood.\(^54\) Evidence also suggests that those who participate in organized sports spend more time in MVPA and are more likely to meet physical activity recommendations (≥ 60 minutes of daily MVPA).\(^55\)

The relationship between organized sport participation and physical activity may vary depending on the sport and the frequency of participation. For example, in a recent study of children from Denmark, those who participated in sports got between five and 20 more minutes of daily MVPA when compared to those who did not participate in organized sports, and were between three and 15 times more likely to meet physical activity recommendations depending on the type of sport and frequency of participation;\(^56\) those who participated in soccer at least once per week accumulated more daily MVPA and were more likely to meet physical activity recommendations than those who did not participate in organized sports. However, children who participated in handball had increased levels of daily MVPA only if they participated in at least two sessions per week. Further, they had to participate in handball at least three times per week to be more likely to meet physical activity recommendations compared to children who did not participate in organized sports. Children participating in gymnastics, basketball or volleyball were not more likely to meet physical activity recommendations.\(^56\)

A couple of longitudinal studies that tracked sport participation from childhood through to adulthood have been published recently. One of the studies, which was based in the United States, tracked children between ages 5 and 19 years (1998 to 2013).\(^57\) Over the years, those who consistently did not participate in sports were never classified as being consistently physically active (approximately 45 minutes of daily MVPA). Further, those who were consistently involved in sports, or who had been involved in sports but dropped out, were never classified over the years as consistently inactive.\(^57\) The other study, out of Great Britain, revealed that children who reported frequent participation in sports at 10 years of age were more likely to be physically active and to participate in sports at 42 years of age.\(^58\) These results provide some evidence that sport participation in childhood may protect against a physically inactive lifestyle and may put children on a trajectory that is associated with more physical activity in adulthood.

**Figure 4.** Prevalence of participation in organized sports among 11- to 15-year-olds in Canada who participate in organized sport, by sport type (source: 2013-14 HBSC).
Contributing Factors and Disparities

Based on new data from the 2014-15 CANPLAY study, age and socioeconomic factors continue to explain some differences in participation rates for organized physical activities or sports. For example, in Canada 15- to 19-year-olds are least likely to participate in organized physical activities or sports compared to 5- to 10-year-olds and 11- to 14-year-olds. Higher participation rates are also seen in children and youth who have parents with the highest incomes or with a post-secondary education. Studies outside of Canada confirm these disparities.
**Active Play**

*This year’s grade is a D+.* New data that match the benchmarks for this indicator have allowed us to grade this indicator for the first time since 2012. These new data reveal that about a third of children and youth are playing outdoors for several hours per day. It should be noted that the target of several hours of active play per day is relatively arbitrary and further research is required to establish a benchmark that is linked to health outcomes.

### Benchmarks

- **A 81-100%**
- **B 61-80%**
- **C 41-60%**
- **D 21-40%**
- **F 0-20%**

- **Percentage of children and youth** who engage in unstructured/unorganized active play for several hours a day.
- **Percentage of children and youth** who report being outdoors for several hours a day.
### Key Findings

- **37% of 11- to 15-year-olds** in Canada report playing outdoors for several hours a day (> 2 hours) outside of school hours (2013-14 HBSC).
- **11- to 15-year-olds** in Canada spend an average of 37 minutes per day playing active video games. This is far less than the average of 2 hours and 24 minutes per day they spend playing sedentary video games (2013-14 HBSC).
- **According to parents**, 75% of 5- to 19-year-olds in Canada participate in unorganized physical activities or sports during the afterschool period (2014-15 CANPLAY, CFLRI).
- **According to parents**, 63% of 5- to 19-year-olds in Canada participate in outdoor play during the afterschool period (2014-15 CANPLAY, CFLRI).
- **Canadian children and youth** who participate in unorganized physical activities or sports during the afterschool period take approximately 2,200 more daily steps than those who do not participate (2014-15 CANPLAY, CFLRI). Those who play outdoors during the afterschool period take approximately 2,500 more daily steps on average than those who do not (2014-15 CANPLAY, CFLRI).

### Research Gaps

- **More observational studies on play** are needed in order to understand what children and youth are doing, and how they are spending their time after school.
- **Further research is required** to identify an evidence-based benchmark for daily active play.
- **There is a need for objective measures** of active play to get a better sense of how much kids are actually doing. This sporadic and unorganized activity is more difficult to report on a questionnaire than other physical activity indicators.
- **More research is needed** on the relationship between active play and health to get a better understanding of how much active play is needed for good health.

### Recommendations

- **Increase parents’ and caregivers’ awareness** and understanding of the benefits versus the risks of outdoor play.
- **Encourage parents** to ensure a balance between scheduled activities and free time during which children can engage in active play.
- **Challenge municipal by-laws** and school policies that restrict opportunities for active outdoor play.
Active Play

Are Parental Safety Concerns Reshaping Play?

In a new cycle of the IKEA Play Report, parents from 12 countries around the world shared their memories of play when they were children. Some of their happiest memories involved active outdoor play (e.g., playing in the woods near home, running around with friends until sunset, playing hide and seek with friends). What is concerning, however, is that modern parental safety concerns may be reshaping play in a way that is harmful to children and youth. For example, 51% of parents with 0- to 18-year-olds say they would like their children to be able to play more outdoors but are too worried about their safety. This represents an increase from 39% in the 2009 cycle of the IKEA Play Report. 39% of parents agree they are “fearful of strangers and this stops [them from] letting [their] children go out to play/hang out with their friends,” which is an increase from 30% in 2009. Screens and gaming consoles may also be reshaping play into more sedentary forms given that 7- to 12-year-olds and 13- to 18-year-olds have, on average, access to 1.5 and 2.2 media devices respectively. Further, approximately half of parents believe that play can include tablets, smartphones or computers. The proportion of children and youth who agree with this is a little less than half. For more information on parental safety concerns and screen time, see Sedentary Behaviours on page 37 and Community & Environment on page 53.

The benefits of active play extend beyond the positive impact on energy expenditure. For example, outdoor play has been linked to improved social relationships (e.g., ability to develop and sustain friendships, to co-operate, to lead and to follow) and emotional well-being (e.g., minimized anxiety, depression and aggression; increased happiness). Further, natural play spaces and natural elements in children’s play spaces can provide physical and cognitive challenges that are important for health and development, such as helping children develop motor skills and learn about their own potential, how to navigate the environment, and how to problem-solve and manage risks in other settings. Accordingly, active play can contribute to improved physical, emotional, social and cognitive development.

Literature Synthesis

Although there is no universally accepted definition of play due to its complexity, active play is often described as a pursuit that has no defined outcome or purpose but that provides children with numerous learning opportunities and a context to be physically active while having fun. When children are engaged in active play, they are generally moving at an intensity that is above resting and sedentary levels, and they are doing so freely and often without the direct guidance or supervision of adults. An additional 49 calories can be expended per day by replacing a single hour of screen time with active play. Canadian children and youth who play outdoors during the afterschool period take approximately 2,500 more daily steps on average than those who do not play outdoors (2014-15 CANPLAY, CFLRI).

The benefits of active play extend beyond the positive impact on energy expenditure. For example, outdoor play has been linked to improved social relationships (e.g., ability to develop and sustain friendships, to co-operate, to lead and to follow) and emotional well-being (e.g., minimized anxiety, depression and aggression; increased happiness). Further, natural play spaces and natural elements in children’s play spaces can provide physical and cognitive challenges that are important for health and development, such as helping children develop motor skills and learn about their own potential, how to navigate the environment, and how to problem-solve and manage risks in other settings. Accordingly, active play can contribute to improved physical, emotional, social and cognitive development.
Supreme Court of British Columbia Rules That Permitting Kids to Play Grounders is Not Negligence

The game “grounders” is a well-known version of tag that is frequently played by children on the playground. In the summer of 2009, an 11-year-old girl in British Columbia was attending a middle school day camp with other children her age. During free playtime, the children decided to play a game of grounders while supervised by a program assistant. During the game, the girl fell backwards from the play equipment and struck her head. Her mother sued the school district, arguing that it was negligent in permitting children to play this inherently dangerous game. The case went to the Supreme Court of British Columbia. In October 2015, the Supreme Court ruled that the school was not negligent in allowing children to play grounders because there is nothing inherently dangerous about the game. Although the judge sympathized with the parent, it was clear that the child’s injury was simply an unfortunate event because there was no evidence that she was pushed or touched prior to the fall. The girl admitted she had simply lost her footing while trying to evade the child who was “it.”

This ruling is encouraging and consistent with the Position Statement on Active Outdoor Play, which advises parents and guardians to recognize the difference between danger and risk, and to encourage risky outdoor play among kids without promoting activities where the risk is unreasonable or involves courting danger (e.g., skating on a half-frozen lake). For more information on the Position Statement, visit www.haloresearch.ca/outdoorplay.

Contributing Factors and Disparities

Among Canadian children and youth, the proportion participating in unorganized physical activities or sports during the afterschool period is greater in boys than girls (78% vs. 72%) and generally decreases with age (87% of 5- to 10-year-olds vs. 60% of 15- to 19-year-olds) (2014-15 CANPLAY, CFLRI). The same trend is seen in outdoor play during the afterschool period (2014-15 CANPLAY, CFLRI). A couple of recent studies abroad also identify lower levels of active outdoor play among children of ethnic minorities, those from lower socioeconomic households and those from neighbourhoods with lower perceptions of social cohesion (connectedness to other groups).

The City of Calgary will be hosting the International Play Conference in 2017, a meeting that takes place every three years. The conference is organized by the International Play Association (IPA), which is a non-governmental organization founded in 1961. The IPA’s purpose is to protect, preserve and promote the child’s right to play as a fundamental human right. The conference will bring together delegates from more than 50 countries to exchange ideas and inspire action about children’s play across many disciplines and sectors.

To learn more about the IPA and the upcoming conference, please visit ipaworld.org/conferences/ipas-20th-triennial-conference-in-canada.
Active Transportation

This year’s grade remains a D. New data continue to show that a low proportion of children and youth use active transportation to get to/from school.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>D</td>
</tr>
</tbody>
</table>

- **Percentage of children and youth** who use active transportation to get to and from places (e.g., school, park, mall, friend’s house).
Key Findings

- **26% of 11- to 15-year-olds** in Canada report using active modes of transportation (24% walking, 2% biking) on the main part of their trip to school (2013-14 HBSC).

- **Based on self-report data** in 5- to 17-year-olds in Canada, 25% typically use active modes of transportation (e.g., walk, bike), 58% primarily use inactive modes (e.g., car, bus), and 17% use a combination of active and inactive modes of transportation to/from school (subsample of 2014-2015 Physical Activity Monitor [PAM], CFLRI).

Research Gaps

- **Research is needed** on active transportation to/from a broader range of destinations (e.g., parks, shops, sport fields).

- **The factors associated** with walking and biking need to be examined separately. Due to low bicycling rates in Canada (Figure 6), current studies tell us little about what might encourage more kids to cycle.

- **Further investigation is needed** on how to increase children’s independent mobility as a strategy to promote active transportation and physical activity. Exploring how independent mobility also supports opportunities for active play is also recommended.

Recommendations

- **Implement traffic-calming measures**, such as speed bumps and narrower intersections, which can reduce vehicle speed and injury risk, and may facilitate active transportation. Such measures are particularly needed in low-income areas where more children walk or wheel to/from school.

- **Develop greater funding** and multi-sectoral collaboration to support active school travel interventions such as walking school buses and school travel planning interventions.

- **Develop bullying prevention efforts** that address the school trip.

- **Employ more** crossing guards.

- **Lower speed limits** in school areas.

- **Consider the feasibility** of active transportation when deciding where to build new schools.
Literature Synthesis

Although a low proportion (25%) of Canadian children and youth actively commute to/from school, it is important to note that this proportion varies considerably when distance from school is taken into account. For example, most children (72%) who live within 1.6 km of their school walk to school. For more information on factors that influence the proportion of children and youth who actively commute to/from school, see Contributing Factors and Disparities below.

Figure 6. Proportion of 11- to 15-year-olds in Canada who report using active transportation on the main part of their trip to school, by active transportation mode and grade (source: 2013-14 HBSC).
Benefits of Active Transportation

Active travelers are more physically active than kids who are driven to school, not just during the trip to/from school but over the course of the entire day. Active travelers get as much as 45 additional minutes of MVPA per day. There is also evidence that kids who bike to/from school have greater cardiovascular fitness than those driven to/from school. A study of Canadian adolescents found that those who biked at least one hour per week had higher cardiovascular fitness, lower body mass index, lower waist circumference and a more favourable cholesterol profile than those who did not bike.

Other benefits that active transportation may offer include the following:

- **Children and parents** who walk or wheel to/from school report more positive emotions during the school trip than those who travel by car.

- **Active travelers**, especially girls, may have higher grades in school.

- **Reducing car trips** can decrease emissions of exhaust gases, which increase the risk of cardiovascular and lung diseases.

Active Transportation Interventions

**Walking school buses** – where children walk in groups supervised by an adult – can increase active transportation and physical activity. However, their sustainability is often compromised by the reliance on parent volunteers. In Ottawa, the regularity and sustainability of walking school buses was increased by hiring adult leaders who are trained, insured and paid – just like school bus drivers and crossing guards (see www.ottawaschoolbus.ca/wsb).

Another promising intervention that is being carried out in a growing number of Canadian schools is school travel planning (see www.saferoutestoschool.ca), where a multidisciplinary committee is established to identify and implement strategies to promote active transportation based on the local school context. Large-scale studies show that school travel plans lead to an increase in active transportation, and a large decrease in pedestrian injuries has been found in New York City.

**The Trottibus Walking School Bus of the Canadian Cancer Society (CCS)** is a pedestrian bus that makes it possible for elementary school children to walk to school from home. The Trottibus Walking School Bus is safe and supervised. It uses trained volunteers to accompany the children; and there is a regular, planned route and scheduled stops.

The CCS offers free guidance to schools that want to put in place a Trottibus Walking School Bus. The CCS’s main role is to train people responsible for the project, provide them with all the tools necessary, and help them recruit volunteers (as needed). The materials required for the safety of the participants (vest for volunteers) are free. Some promotional tools and logistics can be ordered at a nominal cost.

For more information, visit www.trottibus.ca/en.

---

**Children and parents** who walk or wheel to/from school report more positive emotions during the school trip than those who travel by car.

**Active travelers**, especially girls, may have higher grades in school.

**Reducing car trips** can decrease emissions of exhaust gases, which increase the risk of cardiovascular and lung diseases.
Many factors influence the likelihood of children and youth engaging in active transportation, and the importance of these factors varies among countries. Canadian studies have concluded that active transportation is more likely in children and youth who:

- **Live closer to their school** \[76,115-117\]
- **Are granted more independent mobility** (i.e., those who have more freedom to move around in their neighbourhood without adult supervision).\[118\]
- **Are boys** \[114,117,119,120\] – this is particularly the case for cycling.\[89\]
- **Live in urban areas**, compared to suburban or rural areas.\[91,92,106,119,121\]
- **Live in the Western provinces** compared to the Eastern provinces.\[119,121\]
- **Live in more socioeconomically deprived areas**.\[80,81,121\]
- **Are in primary school** compared to students in secondary school.\[122\]

Although it sounds counterintuitive, one strategy that could help reduce the number of injuries associated with walking or cycling to school would be to increase the proportion of children who use active modes of transportation and to develop the appropriate infrastructure to support this change. Mounting evidence shows, for example, that purpose-built cycling infrastructure can both prevent injuries and encourage more people to bike.\[102-106\] A recent national study also found that the risk of hospitalization decreased by 31% for each 1% increase in the proportion of trips made by bicycle at the provincial level.\[107\] A Toronto study found that injury risk did not increase with the number of children walking to school. However, the risk was strongly associated with the design of intersections.\[108\] Despite the risk of injury, the benefits of active transportation far exceed the risks.\[109-111\] In addition, it should be pointed out that inactive transportation is not without its own risks: a study out of Toronto observed dangerous behaviours when students were dropped off at school by car (e.g., stopping in the middle of the road to drop kids off) at 88% of elementary schools involved in the study,\[112\] suggesting that the most dangerous part of a child’s day might be on the drive to school in the morning.\[113\]
**Physical Literacy**

*This is the first year the Physical Literacy indicator is being graded.* The grade is a D+ because the available data suggest that slightly less than half of children in Canada are meeting the recommended levels for physical literacy. The presence of a gender disparity prevents the grade from entering the C range.

- **Percentage of children and youth** who meet the recommended levels of physical competence, knowledge, motivation and daily behaviours needed for a physically active lifestyle.
Key Findings

- **44% of 8- to 12-year-old Canadians** assessed by the Canadian Assessment of Physical Literacy (CAPL) meet or exceed the minimum level recommended for physical literacy (2011-16 CAPL, Healthy Active Living and Obesity Research Group [HALO]).

- **28% of 8- to 12-year-old Canadians** assessed by the CAPL meet or exceed the minimum level recommended for the physical competence domain of physical literacy (2011-16 CAPL, HALO).

- **44% of 8- to 12-year-old Canadians** assessed by the CAPL meet or exceed the minimum level recommended for the daily behaviour domain of physical literacy (2011-16 CAPL, HALO).

- **37% of 8- to 12-year-old Canadians** assessed by the CAPL meet or exceed the minimum level recommended for the motivation and confidence domain of physical literacy (2011-15 CAPL, HALO).

- **62% of 8- to 12-year-old Canadians** assessed by the CAPL meet or exceed the minimum level recommended for the knowledge and understanding domain of physical literacy (2011-16 CAPL, HALO).

Note: Due to limited availability of other datasets, only CAPL data was used to inform the grade. We will continue to work with other physical literacy assessment tool providers to include additional data in future Report Cards. If readers have access to physical literacy data that would inform this grade, please forward to ParticipACTION (info@participACTION.com).

Research Gaps

- **More research is needed** to determine how to integrate different monitoring methods and/or underlying components to assess progress in physical literacy.\(^\text{123}\)

- **There is a need for research** on the benefits associated with increased levels of physical literacy.\(^\text{123}\)

- **We need to learn more** about the consequences of the growth of interest in physical literacy for physical education.

Recommendations

- **Widely communicate** the commonly accepted definition of physical literacy, in order to enhance the overall understanding of physical literacy and each of its elements.

- **Based on the definition**, create key messages written in plain language that describe physical literacy in the context of each sector and in a way that makes it understandable to leaders and the general public.

- **Identify and share** initiatives and strategies that develop all elements of physical literacy, not just fundamental movement skills.
Physical Literacy

The Canadian Assessment for Physical Literacy (CAPL) (www.capl-ecsfp.ca), by the Healthy Active Living and Obesity Research Group, is a validated and reliable physical literacy assessment for 8- to 12-year-olds.\textsuperscript{126-128} The CAPL assessment examines the four components of physical literacy through daily behaviour (daily average step count, self-reported physical activity and sedentary time), physical competence (cardiovascular endurance, handgrip strength, flexibility, core strength, motor skills, body mass index percentile and waist circumference), knowledge and understanding, and motivation and confidence.

The Fundamental Movement Skills (FMS) Assessment Tool (www.60minkidsclub.org), by 60 Minute Kids’ Club, is a tool that has resources to assess, show, teach and activate children’s fundamental movement skills.

The wide variety of physical literacy assessments shows the importance being placed on increasing children’s physical literacy in Canada. Increased physical literacy – or having the skills, behaviours, confidence and motivation, as well as the knowledge and understanding necessary to be physically active – can help place children in a better position to receive the many benefits of physical activity (see Why is Physical Activity Important? on page 6).\textsuperscript{124}

Behaviours Linked with Increased Physical Literacy

A recently published study of 9- to 11-year-olds in Ottawa reveals a positive link between time spent outdoors on weekends and physical literacy scores as assessed by the CAPL.\textsuperscript{129} Active transportation to school is also related to higher physical literacy scores.\textsuperscript{129} The results are not conclusive, but provide some evidence that increasing outdoor time and active school transportation might be an effective strategy for increasing physical literacy in children.
**CANADA’S PHYSICAL LITERACY CONSENSUS STATEMENT**

The current physical inactivity crisis in Canada highlights the need not only to promote physical activity but to teach children the basic skills needed to live a healthy active lifestyle. In an effort to address these basic movement skills, the concept of physical literacy has emerged and gained substantial popularity in Canada and around the world, leading to several differing definitions that have contributed to confusion around the meaning of the term. Consultation with stakeholders in Canada has revealed the need for a common definition with consistent language to facilitate the development of policy, practice and research related to physical literacy.

In 2014, a steering committee consisting of 10 physical literacy experts from seven organizations was tasked with harmonizing a Canadian definition of physical literacy. The result of this meeting was to adopt the International Physical Literacy Association’s definition, which was the result of a rigorous and systematic process involving stakeholders from around the world.130 “Physical literacy is the motivation, confidence, physical competence, knowledge and understanding to value and take responsibility for engagement in physical activities for life.”131

The steering committee also harmonized five core principles of physical literacy, and definitions for the four essential and interconnected elements of physical literacy: motivation and confidence; physical competence; knowledge and understanding; and engagement in physical activities for life. The resulting two-page consensus statement was sent out to stakeholders across Canada for feedback, and more than 1,300 responses were received. The final consensus statement was released at the Vancouver International Physical Literacy Conference in June 2015.132 View the Physical Literacy Consensus Statement at www.participaction.com/canadas-physical-literacy-consensus-statement.

---

**RBC Learn to Play Programs**

In 2014, the RBC Learn to Play Project provided 107 community action grants to support programming and 29 leadership grants to develop community level capacity. The grants supported collaborative efforts of over 450 organizations across Canada. Based on grantee reports received, 91% of grantees agreed that collaboration increased, 325 new partnerships were developed, 2,286 people were trained in program development/delivery, 8,878.5 hours of programming was delivered, and 61,401 children and youth participated. After attending training 88% of trainees had very high to excellent understanding of physical literacy (72% reported an increase) and 96% of trainees intended to apply what they learned. Before and after program surveys revealed significant improvements in competence and motivation among participants 2-24 years old and in confidence among participants 6-12 years old. Additionally, after programs, 77% of parents reported increased awareness of physical literacy. This represents two surveys, before and after program participation, that assesses self-report (parent or child respondent) confidence, competence, and motivation based on scales within the CS4L Play Tools, and a yes/no question asking parent respondents whether their awareness of physical literacy increased. Before and after data was not linked by respondent.

**Contributing Factors and Disparities**

Based on data from more than 5,700 children aged 8 to 12 years from six provinces across Canada, a slightly higher proportion of boys (47%) meet the recommended levels for physical literacy compared to girls (41%) (2011-16 CAPL, HALO). When broken down by physical literacy domain, this gender disparity persists for physical competence (32% of boys vs. 23% of girls meet the recommended levels), daily behaviour (47% of boys vs. 41% of girls), and motivation and confidence (41% of boys vs. 32% of girls). For knowledge and understanding, however, the gender disparity is reversed: 64% of girls meet the recommended levels vs. 60% of boys.
Sleep

The grade for this new indicator in the Report Card is a B because well over half of children and youth in Canada meet the new sleep recommendations in the Canadian 24-Hour Movement Guidelines for Children and Youth.

- **Percentage of children and youth** who meet the sleep recommendations in the Canadian 24-Hour Movement Guidelines (5- to 13-year-olds: 9-11 hours per night; 14- to 17-year-olds: 8-10 hours per night).133,134
Sleep

Key Findings

- **68% of 10- to 13-year-olds** in Canada meet the sleep recommendations for school-aged children (2013-14 HBSC).
- **72% of 14- to 17-year-olds** in Canada meet the sleep recommendations for adolescents (2013-14 HBSC).
- **79% of 5- to 13-year-olds** in Canada meet the sleep recommendations for school-aged children, which recommend sleeping between 9 and 11 hours per night (2012-13 CHMS, Statistics Canada).
- **68% of 14- to 17-year-olds** in Canada meet the sleep recommendations for adolescents, which recommend sleeping between 8 and 10 hours per night (2012-13 CHMS, Statistics Canada).
- **43% of grades 9 to 12 students** aged 17 years and younger in Ontario and Alberta meet the sleep recommendations for adolescents (2012-13 Cohort Study for Obesity, Marijuana Use, Physical Activity, Alcohol Use, Smoking and Sedentary Behaviour [COMPASS]).
- **33% and 45% of 5- to 13-year-olds and 14- to 17-year-olds** in Canada, respectively, have trouble going to sleep or staying asleep at least some of the time (2012-13 CHMS, Statistics Canada).
- **96% and 83% of 6- to 13-year-olds and 14- to 17-year-olds** in Canada, respectively, find their sleep refreshing at least some of the time (2012-13 CHMS, Statistics Canada).
- **12% of 5- to 13-year-olds and 36% of 14- to 17-year-olds** in Canada, respectively, find it difficult to stay awake during their normal waking hours when they want to at least some of the time (2012-13 CHMS, Statistics Canada).

Research Gaps

- **To better inform sleep recommendations**, there is a need for research involving sleep restriction/extension interventions that examine the changes in different outcome measures against various amounts of sleep. These studies will give a better sense of the dose-response relationship between sleep and different outcomes.
- **More epidemiologic studies** need to use an objective assessment of sleep (e.g., accelerometry/actigraphy) because time in bed does not necessarily reflect sleep duration.
- **Beyond sleep quantity**, more studies need to report on other important dimensions of sleep including quality, timing, consistency and continuity.

Recommendations

- **Encourage families** to develop household bedtime rules.
- **Remove screens** and media devices (e.g., cellphones, computers, TVs) from bedrooms.
- **Delay school start times** for adolescents – even by as little as 30 minutes – as a countermeasure to chronic sleep deprivation.
- **We should all take sleep more seriously** in our busy, work-obsessed society instead of viewing it as a waste of time.
Sleep is an essential component of healthy development and is required for physical and mental health. Unfortunately, sleep deprivation has become common in contemporary societies with 24/7 availability of commodities and technologies. Children and youth generally sleep less now compared with decades ago; factors responsible for this decline in sleep duration over time are generally ascribed to the modern way of living (e.g., late-night screen time, caffeine use, no bedtime rules in the household). A growing body of evidence shows that chronic sleep deprivation poses a serious threat to the academic success, health and safety of children and youth, and is an important public health issue to that needs to be addressed. A recent systematic review including 592,215 children and youth from 40 different countries reported that short sleep duration was associated with excess body weight, poorer emotional regulation and academic achievement, and lower quality of life/well-being.

In 2016, Canadian sleep duration recommendations have been issued for the first time. They recommend that to maximize overall health and well-being, school-aged children (aged 5-13 years) should sleep between 9-11 hours each night and that adolescents (ages 14-17 years) should sleep between 8-10 hours each night. Although the ideal amount of sleep per night may vary from one person to another, sleep duration recommendations play an important role in informing public policies, interventions, and parents and their children/youth of healthy sleep behaviours. It is, therefore, critical to continue promoting the importance of a good night’s sleep for the overall health of Canadian children and youth, and to take sleep more seriously.

It is also important to remember that sleep interacts with physical activity and sedentary behaviour; these three behaviours are not independent of each other. For example, being physically active on a regular basis can promote a good night’s sleep. Screen time has been shown to disrupt sleep and can displace physical activity for some people. Finally, insufficient sleep can reduce physical activity levels and is associated with more screen time in children. As a result of this, the Canadian 24-Hour Movement Guidelines for Children and Youth have been developed and released (see page 9). Public health messages should target all movement behaviours synergistically to optimize health of children and youth around the world.
Contributing Factors and Disparities

Based on CHMS and HBSC data, there is no significant difference in the proportion of boys and girls who meet the sleep recommendations. As it relates to trends over time, data from the United States reveal that declines in sleep duration over the past several years have been more pronounced in girls, racial/ethnic minorities and those from low socioeconomic backgrounds.\textsuperscript{14} Whether this is also the case in Canada is currently unclear.

Table 1. Sleep duration recommendations (source: Hirshkowitz et al.\textsuperscript{134}).

GENERAL TIPS FOR HAVING HEALTHY SLEEP HYGIENE\textsuperscript{142}

- Go to bed and wake up at the same time every day (even on the weekends!)
- Avoid caffeine consumption (e.g., coffee, soft drinks, chocolate) starting in the late afternoon
- Expose yourself to bright light in the morning – sunlight helps the biological clock to reset itself each day
- Make sure your bedroom is conducive to sleep – it should be dark, quiet, comfortable, and cool
- Sleep on a comfortable mattress and pillow
- Don’t go to bed feeling hungry, but also don’t eat a heavy meal right before bed
- Develop a relaxing routine before bedtime – ideas include bathing, music, and reading
- Reserve your bedroom for sleeping only – keep cell phones, computers, televisions and video games out of your bedroom
- Exercise regularly during the day
- Don’t have pets in your bedroom
Sedentary Behaviours

This year’s grade returns to an F due to new data, which show that very few children and youth at any age are meeting the sedentary behaviour recommendations in the Canadian 24-Hour Movement Guidelines for Children and Youth.

- **Percentage of children and youth** who meet the Canadian Sedentary Behaviour Guidelines (3- to 4-year-olds: less than one hour of screen time per day; 5- to 17-year-olds: no more than two hours of screen time per day).

Note: The Guidelines currently provide a time limit recommendation for screen-related pursuits, but not for non-screen-related pursuits.

* In 2011 and 2012, there were two separate indicators: Screen-Based Sedentary Behaviours and Non-Screen Sedentary Behaviours. Following 2012, these indicators were collapsed into a single indicator.
Key Findings

- **10% of 11- to 15-year-olds** in Canada meet the sedentary behaviour recommendations in the Canadian 24-Hour Movement Guidelines for Children and Youth, which recommend an average daily screen time of no more than 2 hours (2013-14 HBSC).
- **76% of 5- to 19-year-olds** in Canada report watching television, playing computer or video games, or reading during the afterschool period (based on a subsample of the 2014-15 CANPLAY, CFLRI).
- **3% of students in grades 9 to 12** in Canada meet the sedentary behaviour recommendations in the Canadian 24-Hour Movement Guidelines for Children and Youth (2012-13 COMPASS study).
- **Students in grades 9 to 12** in Canada spend an average of 8.2 hours per day (494 minutes) in screen-based sedentary behaviour (2012-13 COMPASS study).
- **15% of 3- to 4-year-olds** in Canada meet the Canadian Sedentary Behaviour Guidelines for the Early Years, which recommend that daily screen time (i.e., use of computers, television, etc.) be limited to less than one hour (2012-13 CHMS, Statistics Canada).
- **24% of 5- to 17-year-olds** in Canada (24% of 5- to 11-year-olds and 24% of 12- to 17-year-olds) meet the sedentary behaviour recommendations in the Canadian 24-Hour Movement Guidelines for Children and Youth, which recommend daily screen time of no more than 2 hours (2012-13 CHMS, Statistics Canada).
- **According to parents in Ontario**, boys and girls get 3.2 hours (193 minutes) and 2.6 hours (158 minutes) of daily screen time respectively (Public Health Ontario, 2015).

Research Gaps

- **Research needs to better differentiate** the effects of screen-based vs. non-screen sedentary behaviours and their influence on health indicators.
- **To better understand the impact** of total sedentary time on health relative to the proportion of time spent in physical activity and sleep, novel analyses (such as compositional analyses) should be used.
- **Monitors that capture posture** should be used in research that is objectively measuring sedentary time to minimize misclassification between light physical activity and sedentary behaviour.
- **Research on new screen time devices**, such as tablets and smartphones, is needed to understand whether these devices are used primarily while seated and how the use of these new devices impact physical, social and mental health.
- **Future research** should account for multitasking of different types of sedentary behaviour.

Recommendations

- **Encourage families to develop household rules around screen time.**
- **Turn off the internet in the home** at children’s bedtime (or even earlier) from evening to morning.
- **Remove screens and media devices** (e.g., cellphones, computers, TVs) from bedrooms.
- **Modeling is important** – parents should set limits around their own screen time use and their children’s screen time use, and stick to it.
Sedentary Behaviours

Factors Associated with Greater Sedentary Time

In light of new data that continue to reveal excessive amounts of daily sedentary time (> 8 hours per day) among children and youth both in Canada and abroad, it is important to understand the behaviours and other factors that are linked to sedentary time, if strategies that lead to their reduction are to be successful. Recent research suggests that having a screen in the bedroom (e.g., television, computer), not meeting physical activity recommendations of at least 60 minutes of daily MVPA, and being heavier are all associated with more daily sedentary time. However, the relationship between body weight and sedentary time may be more complex and nuanced than this. A recent comparison of normal-weight children and youth in Canada with their obese peers, for example, did not find any differences in sedentary time, which highlights the importance of targeting all children and youth — not just those with obesity — when implementing strategies to reduce sedentary behaviours. Another behaviour linked to sedentary time is sleep. Children who get less than 9 hours of sleep per night have greater daily sedentary time than children who get recommended amounts of sleep (9 to 11 hours per night). A similar link between sleep and sedentary time may also apply to 2- to 5-year-olds. For more information on sleep, read about our new Sleep indicator on page 33.

DON'T WALK IN THE HALLWAY!

In an effort to break up sedentary time and introduce more physical activity into the school day, Elm Street School in Medicine Hat, Alberta, has placed coloured squares on the floor of its main hallway as part of a pilot project through the YMCA to encourage students to engage in different movement behaviours (e.g., hopping, skipping, jumping) throughout the school day. To learn more about this pilot program, visit medicinehatnews.com/news/local-news/2016/01/06/pilot-program-at-elm-street-school-aims-to-pair-hallway-time-with-physical-activity.
A new study has found that the main reasons parents report using strollers include transportation, storage, leisure, supervision/confinement, parental physical activity and sleep. Three key benefits of stroller use, according to parents, are convenience, timeliness and the ability to travel a distance that would not otherwise be feasible. In some cases, parents view stroller use as facilitating sedentary time because the child would otherwise be walking or crawling if not immobilized in a stroller. In other instances, however, parents view stroller use as serving to decrease sedentary time and increase physical activity because the stroller is being used as a vehicle to take their child to a park for play, a destination the parent wouldn’t necessarily feel safe walking to without a stroller (e.g., due to busy streets or the lack of a sidewalk). This is a relatively new area of research and seems to suggest that stroller use is not straightforward. It is important to note, however, that the Canadian Sedentary Behaviour Guidelines for the Early Years recommend limiting prolonged sitting or restraint (e.g., strollers).
According to parents in Ontario, boys spend 28 more minutes per day playing videogames than do girls. In addition to this gender disparity, there are age-related differences in screen time. When comparing Canadian children and youth who meet the sedentary behaviour recommendations in the Canadian 24-Hour Movement Behaviour Guidelines for Children and Youth by school grade, the proportion of grade 6 students who meet the Guidelines is approximately double the proportion of students who meet the recommendations in grades 7 through 10 (Figure 7). However, when daily time spent in screen-based sedentary pursuits is compared by school grade within older Canadian youth (grades 9 to 12), screen time is comparable across grades (Figure 8).
INDICATORS: Settings & Sources of Influence

3/4 of schools in Canada report using a physical education (PE) specialist to teach PE in their school. 2015 OPASS
Family & Peers

The benchmarks for this indicator relate to family physical activity and peer influence. Since a lack of gradable data continues for peer influence, the grade is informed by family physical activity data. This year’s grade is a C+ for the second year in a row and reflects new data revealing that parents understand the importance of physical activity for children and youth.

- **Percentage of parents** who facilitate physical activity and sport opportunities for their children (e.g., volunteering, coaching, driving, paying for membership fees and equipment).
- **Percentage of parents** who meet the Canadian Physical Activity Guidelines for Adults.
- **Percentage of parents** who are physically active with their kids.
- **Percentage of children and youth** with friends and peers who encourage and support them to be physically active.
- **Percentage of children and youth** who encourage and support their friends and peers to be physically active.

* In 2005, there were two separate indicators: Family Physical Activity and Ensuring Kids are Active. In 2006, there were three separate indicators: Family Physical Activity, Ensuring Kids are Active and Parent Perspectives on Activity. In 2008, there were again two separate indicators: Family Perceptions & Roles Regarding Physical Activity and Ensuring Kids are Active.
Key Findings

- **36% of parents** in Canada with 5- to 17-year-olds report playing active games with them (based on a subsample of the PAM 2014-2015, CFLRI).

- **A majority of parents** in Ontario report facilitating physical activity and sport opportunities for their children (Public Health Ontario, 2015):
  - 80% are physically active with their child.
  - 82% enroll their child in sports, clubs or community programs.
  - 86% encourage their child to walk or bike to destinations that are reasonably close.
  - 87% watch their child play sports or engage in other physical activities.
  - 91% encourage their child to use resources in the community.
  - 94% take their child to places where they can be physically active.
  - 97% encourage their child to be physically active outdoors with others.

- **32% of 18- to 39-year-olds** and 18% of 40- to 59-year-olds in Canada meet the Canadian Physical Activity Guidelines for Adults, which recommend at least 150 minutes of weekly MVPA (2012-13 CHMS, Statistics Canada).

- **A majority of mothers** in Canada with a 5- to 12-year-old child intend to support their child’s physical activity, but less than half follow through with their intention.

- **78% of parents** in Ontario report that they enforce rules relating to their child’s screen time (Public Health Ontario, 2015).

Research Gaps

- Although peer-based physical activity interventions have shown potential, they need to be better studied and evaluated.

- Further research examining the disconnect between parents’ intentions to facilitate their children being active and their actual behaviour is required.

Recommendations

- When developing interventions aimed at increasing physical activity and decreasing screen time, target the entire family to maximize impact.

- Continue to provide opportunities for children and their parents to engage in physical activity together in their communities.

- Encourage parents to regularly plan for physical activities for their children and family on evenings, weekends and holidays.
According to a recent meta-analysis of 115 studies, relationships exist between parental modeling and their child’s physical activity, and between parental support (e.g., parent-child co-activity, encouragement, praise, transportation) and their child’s physical activity. However, the relationship between parental support and physical activity was much stronger than the relationship between parental modeling and physical activity. Interestingly, the relationship between fathers’ modeling of physical activity and the physical activity of their sons was significantly stronger than the relationship between mothers’ modeling of physical activity and their sons’ physical activity. Finally, no relationship was found between parental modeling and the physical activity levels of their daughters. The link between parental support and child physical activity appears to apply to preschoolers as well. In a recent study out of Alberta, every unit increase in parental supported physical activity, as measured by a questionnaire, was associated with an additional 48.5 minutes of physical activity per week among young children (19- to 60-month-old) in the autumn and an additional 52.5 minutes of physical activity per week in the summer.

Research continues to show that parents can have an influence on the physical activity levels of their kids. In a recent study in Ontario, when an equal proportion of parents were placed in one of four groups based on their physical activity levels, parents in the group with the lowest physical activity were almost three times as likely to have children who were also in the group of children with the lowest physical activity. This relationship was stronger in two-parent homes vs. single-parent homes. Evidence from a Québec study also suggests that parents who report higher levels of co-participation in physical activity – doing activities as a family - also appear to have more physically active children. This may be due to the fact that co-participation acts as an opportunity for more physical activity, but also allows parents to display positive modeling.

Figure 9. Proportion of Ontario parents who report facilitating their child’s physical activity and sport opportunities, in various ways (source: Public Health Ontario, 2015).
Peer Influence

Parents believe their children’s friends have a stronger influence on their structured physical activity (e.g., sport participation) while siblings are believed to have a greater influence on informal and spontaneous forms of physical activity (e.g., active play). In a recent study out of Saskatoon, children who reported higher levels of active transportation with their peers were also more likely to get more daily MVPA.

Three recent Canadian intervention studies used peer-based approaches to try and increase physical activity levels in children. Go Girls! paired girls with peers of similar age, gender and grade, in a program designed to have them encourage and learn from one another in terms of active living, and to improve each other’s attitudes toward physical activity. The pairs of girls met every week for seven weeks and after the program ended, the girls had higher levels of physical activity and confidence in their abilities to engage in physical activity. The Heart Healthy Kids program paired grades 4 to 6 children with peer mentors (children from the same age group, classes and school, who volunteered to promote active play whenever possible with their peers). A separate group of schools served as a control. Children in schools with the Heart Healthy Kids program had higher levels of physical activity after the program than before, and also had higher levels of physical activity after the program compared to children from schools that did not take part in the program. An evaluation of a peer-mentoring intervention to prevent weight gain in First Nations children living on reserves (the Aboriginal Youth Mentorship Program) found lower rates of weight gain and improved healthy living knowledge and confidence in grade 4 students from a remote isolated community in Manitoba who participated in the peer-mentoring program for five months compared to their peers. These studies provide some evidence that peer mentorship programs may be an effective approach to promoting physical activity in children.
Physical activity is influenced by many things, including a combination of perceived capability, opportunity and motivation on the part of the individual. For children, this is particularly true because they may have yet to develop the skills to participate in a specific activity or sport (i.e., physical literacy) and have limited control over when and how they can access organized activities (i.e., parents are the gatekeepers). Perhaps most important, motivation is influenced by the extent to which children have a choice about what they do, experience competence and challenge, and feel a sense of relatedness. To the extent that these three needs are satisfied by participating in an activity (e.g., play, sport, swimming lessons), children are more likely to keep engaging in it. To encourage continued participation, youth should be asked what activities they personally find fun, and should be given the opportunity and choice to try different activities. Parents should avoid pressuring youth or making them feel guilty for being inactive, because this tends to undermine sustained motivation.

Goals can also be helpful in regulating behaviours. Think about setting some SMART goals (Specific, Measurable, Adjustable, Realistic and Timely). Also, think about the orientation of the goal and ensure the focus of the goal is related to tasks (e.g., “I want to improve the form of my free throw shot”) rather than on outcomes (e.g., “I want to win the game” or “I want to get a basket”). Children and youth with task-oriented goals are more likely to continue with an activity and have positive moods as a result.

Children and youth should also be encouraged to engage in physical activities with people they care about – for example, plan family physical activities or invite their friends for a game of hockey on the local outdoor rink. Children and youth also learn from watching other people, so parents and siblings should try to make sure they set a good example, and incorporate more physical activity and less sitting into their own day.

The bottom line is that children and youth will be more physically active when they are in environments that are supportive, nurturing and focused on tasks rather than outcomes, and when they have a say in choosing the activities. Encourage exploration and use some of these strategies to try to support children and youth to be more physically active.
School

The benchmarks for this indicator relate to physical education and physical activity opportunities at school and in childcare settings, school policy and programming, and school infrastructure and programming. This year’s grade improves to a B due to new data showing progress in the areas of physical education and school infrastructure.

*** BENCHMARK A 81-100% B 61-80% C 41-60% D 21-40% F 0-20%***

- **Percentage of schools** with active school policies (e.g., daily physical education [PE], daily physical activity, recess, “everyone plays” approach, bike racks at school, traffic calming on school property, outdoor time).
- **Percentage of schools** where the majority (≥ 80%) of students are taught by a PE specialist.
- **Percentage of schools** where the majority (≥ 80%) of students are offered at least 150 minutes of PE per week.
- **Percentage of schools** that offer physical activity opportunities (excluding PE) to the majority (≥ 80%) of their students.
- **Percentage of parents** who report their children and youth have access to physical activity opportunities at school in addition to PE classes.
- **Percentage of schools** with students who have regular access to facilities and equipment that support physical activity (e.g., gymnasium, outdoor playgrounds, sporting fields, multipurpose space for physical activity, equipment in good condition).

* From 2005 to 2012, there were two separate indicators: Physical Education and Sport & Physical Activity Opportunities at School. In 2013, these indicators were collapsed into a single indicator.

** From 2009 to 2012, there were two separate indicators: School Policy and Sport & Physical Activity Opportunities at School. In 2013, these indicators were collapsed into a single indicator.
Key Findings

- **Three quarters of schools** in Canada report that they use a Physical Education (PE) specialist to teach PE in their school. 43% indicate that they use a teacher with at least one elective credit in PE (2015 Opportunities for Physical Activity at School Study [OPASS], CFLRI).

- **Of those who indicate that their school uses a PE specialist**, 15% indicate that less than half of students receive PE directly from this individual, 18% of schools indicate that many or most of their students receive PE from this specialist and 68% indicate that almost all students receive PE instruction from a specialist (2015 OPASS, CFLRI).

- **The following proportion of schools/school boards/ministries** in Canada report that they have fully or partially implemented policies related to physical activity:
  - 77% provide age- and stage-appropriate developmental physical activity and sport programs.
  - 73% provide a range of physical activities for students.
  - 69% have a policy providing daily PE to all students.
  - 69% have a policy providing mandated physical activity to all students.
  - 62% hire teachers with university qualifications to teach PE or activity.
  - 59% ensure ongoing funding for adequate equipment for student needs.
  - 28% ensure National Coaching Certification Program qualifications for coaches.
  - 25% provide opportunities for active transportation of students to and from school (2015 OPASS, CFLRI).

- **Below are the proportion of schools/school boards** in Canada that report having agreements with:
  - **Municipalities**: 81% regarding shared use of school or municipal facilities, 48% regarding shared resources and programming.
  - **Sport organizations or physical activity clubs**: 82% regarding use of school facilities, 53% regarding shared resources and programming (2015 OPASS, CFLRI).

- **School administrators** in Canada report that a number of facilities are available on-site at school including equipment for physical activity (97%), gymnasiums (94%), playing fields (88%), other green spaces or play areas (88%), paved areas used for active games (80%), outdoor basketball hoops (78%) and areas with playground equipment (71%) (2015 OPASS, CFLRI).

- **School administrators** in Canada report that:
  - Their students have access to bicycle racks (80%) and change rooms (74%) during school hours.
  - A number of facilities are available off-site near school including other green spaces (89%), playing fields (84%), skating rinks (82%), areas with playground equipment (78%), baseball diamonds (75%) and walking/bicycling trails (74%).
  - The indoor facilities (76%) and outdoor facilities (65%) for physical education and extracurricular physical activity programs located on school grounds meet the needs of students quite or very well.
  - The indoor facilities (46%) and outdoor facilities (59%) for other types of physical activity and play located on school grounds meet the needs of students quite or very well (2015 OPASS, CFLRI).
School

Research Gaps

- **More research is needed** on the quality of physical activity at school (e.g., physical literacy) and especially in childcare settings.

- **Information is needed** on the investment required to ensure each Canadian child is exposed to daily PE and is taught or supported by PE specialists.

- **Research is needed** on factors at the student-, school- and community-level that influence participation in physical activity at school.

Recommendations

- **Gear physical activity** opportunities and PE toward fun and participation as opposed to competition to make sure these activities are inclusive.

- **All schools** in Canada should either employ, or be supported by, PE specialists.

- **When developing sport** and physical activity policies and programs, ensure that all children have the opportunity to participate on schools teams, in intramural programs and in recess and lunchtime games, depending on their interest.
Literature Synthesis

Physical Activity at School

The school environment is an important setting for physical activity promotion in children and youth, since they spend much of their time on weekdays in school with many contexts for physical activity (Table 2). A recent review identified a number of factors that are necessary in order to increase physical activity levels at school, including:174

- **Policies** (e.g., a policy around the quantity and quality of PE per week).
- **Organizational factors** (e.g., leadership around and accountability for physical activity policies).
- **Student factors** (e.g., options for physical activity at school based on age, gender, race/ethnicity, prior experiences and interests may be met with more success).
- **Family factors** (e.g., parents who become champions of physical activity and either initiate or volunteer for programs such as a walking school bus may also lead to increased school-based physical activity).

Many of the challenges to increasing school-based physical activity in children and youth often relate to factors such as competing academic priorities and lack of buy-in (which make policy implementation more difficult), and heterogeneity in the student body (which makes it difficult to offer physical activity opportunities that are enticing for everyone in the study body).174

Table 2. Contexts for school-based physical activity (source: adapted from Hatfield and Chomitz, 2015174).

Reducing Sitting Time at School

In addition to increasing school-based physical activity, reducing school-based sedentary time is also important given that children and youth spend between 50% and 70% of their time at school sitting.175 A global review of studies that used different “anti-sitting” approaches (e.g., standing desks, exercise balls) to reduce sitting time at school found resulting decreases in sedentary time (between 44 to 60 minutes per day) and increases in standing time (between 18 to 55 minutes per day) during classes.175 Another review of studies involving only standing desks to reduce sedentary time found a similar result, with decreases in daily sitting time at school ranging between 59 to 64 minutes.176 Interestingly, a grade 1 teacher in Saskatchewan made headlines when he adopted one of those anti-sitting approaches by raising the height of the desks in his classroom so that students could stand at their desks.177 He was motivated by research showing that excessive sitting is linked with health problems in adulthood. Anecdotal evidence of the benefits of this teacher’s anti-sitting approach included improved attention and posture in some of the students, and even improved sleep at nighttime.177
Contributing Factors and Disparities

Based on the 2015 OPASS study, schools with the largest student populations are generally more likely to have certain on-site facilities such as gymnasiums and other rooms, fitness centres, playing fields, tennis courts and running tracks. These schools are also more likely to have some physical activity-related policies such as ongoing funding of equipment and hiring teachers with qualifications in physical education or physical activity.
Community & Environment

The benchmarks for this indicator relate to community policy and programming, availability of infrastructure (e.g., parks and playgrounds), neighbourhood safety and the natural environment. This year’s grade has improved slightly to an A- due to new data that show improvements in community policy and perceptions of neighbourhood safety.

**BENCHMARK**

- **A 81-100%**
- **B 61-80%**
- **C 41-60%**
- **D 21-40%**
- **F 0-20%**

- **Percentage of children or parents** who perceive their community/municipality is doing a good job at promoting physical activity (e.g., variety, location, cost, quality).
- **Percentage of communities/municipalities** that report they have policies promoting physical activity.
- **Percentage of communities/municipalities** that report they have infrastructure (e.g., sidewalks, trails, paths, bike lanes) specifically geared toward promoting physical activity.
- **Percentage of children or parents** who report having facilities, programs, parks and playgrounds available to them in their community.
- **Percentage of children or parents** who report living in a safe neighbourhood where they can be physically active.
- **Percentage of children or parents** who report having well-maintained facilities, parks and playgrounds in their community that are safe to use.

* In the years prior to 2013, there were two separate indicators: Municipal Policies & Regulations and Community Programming. In 2013, these indicators were collapsed into a single indicator: Community Policy & Programming.
** In 2005 and 2006, this indicator was called Proximity & Availability of Facilities, Programs, Parks & Playgrounds. The 2007 grade reflects both availability and usage. In all other years, availability was graded on its own.
*** This indicator has been in the Report Card since 2011 and was called Nature & the Outdoors until this year.
Key Findings

- **Among municipalities** in Canada with more than 1,000 residents:
  - 35% have a formal strategy for physical activity and sport. Slightly more than half consider sport (55%) and physical activity (56%) a moderately high or very high priority in relation to certain other health considerations.
  - 81% and 52% have shared use agreements with school boards in relation to facilities and resources/programming, respectively.
  - 88% and 64% have shared use agreements with sport organizations/physical activity clubs in relation to facilities and resources/programming, respectively.
  - The following proportion of municipal recreation departments work with various groups when developing facilities, programs and services: 94% (not-for-profit organizations), 86% (schools and school boards), 75% (provincial government or agencies), 71% (business or private sector), 67% (local public health department), 61% (local planning department), 61% (provincial sport organizations), 35% (federal government or national agencies) and 32% (local transportation department) (2015 Physical Activity Opportunities in Canadian Communities survey, CFLRI).

- **Less than 20% of parents** report that crime, safety or poorly maintained sidewalks are an issue in their neighbourhood (based on a subsample of the 2014-2015 PAM, CFLRI).

- **The homicide rate** in Canada in 2014 for all ages (1.45 per 100,000) is 17% lower than in 2011 (1.74 per 100,000) (2011-14 Uniform Crime Reporting Survey, Statistics Canada).178

- **The total rate** of sexual violations against children in Canada in 2014 (12.53 per 100,000) is 13% higher than in 2011 (11.08 per 100,000) (2011-14 Uniform Crime Reporting Survey, Statistics Canada).178

- According to Statistics Canada, the recent increase over time in total sexual violations against children is primarily due to increasing incidents of child-luring via a computer.178 The rate of luring a child via a computer in 2014 (3.35 per 100,000) is 103% higher than in 2011 (1.65 per 100,000) (2011-14 Uniform Crime Reporting Survey, Statistics Canada).178

- **Note:** “It is important to note that for the violations included in ‘sexual violations against children,’ differences in police-reported statistics between geographic areas or across time may be influenced by levels of reporting to police, as well as by single incidents that include several victims. In addition, certain police services dedicate special units to investigate these types of crime, which can also impact differences by geographic areas or changes over time. Similar to sexual assaults in general, the number of sexual violations against children is also expected to be an underestimate due to compounding factors that are likely to impact reporting, such as reliance on an adult to bring the incident to the attention of police.”179

- **The child abduction rate** by non-parents/non-guardians in Canada in 2014 for children and youth under 14 years of age (0.32 per 100,000) is 27% lower than in 2011 (0.44 per 100,000) (2011-14 Uniform Crime Reporting Survey, Statistics Canada).178
Research Gaps

- **Research is needed** to test the effectiveness of new technology (e.g., GPS for geocaching) in increasing active outdoor play and connection with nature.

- **More information** is required on patterns of physical activity and sedentary behaviour in rural and remote regions and/or communities.

- **Evaluations are required** of the Health Background Study Framework, which is a tool developed by Peel Public Health and Toronto Public Health that helps identify minimum standards for built environment core elements (e.g., density, service provision, land-use mix, street connectivity, streetscape characteristics, parking) that developers should address in their applications.180

- **It would be useful** to evaluate the extent to which programs such as the Young Hunters Program in Nunavut and Take a Kid Trapping in the Northwest Territories encourage physical activity among youth in northern and remote regions.

Recommendations

- **Encourage the development** of protected bicycle paths and lanes, which are required to reduce safety concerns and increase active commuting.

- **Create and promote** the development of natural playgrounds to supplement or replace traditional playgrounds in order to help engage children in outdoor play and enhance their connection with nature. Natural playgrounds are areas where children can play with natural elements such as sand, water, wood and living plants.

- **Ensure that children and youth** with disabilities are always included and integrated into community programs by providing appropriate training to recreation leaders.
Community & Environment

Literature Synthesis

Targeted Physical Activity Programming or Scheduling

The last time the Report Card presented Canadian municipal survey data was in 2012. Figure 10 provides fresh insight into targeted physical activity programming in Canadian communities of different sizes.

![Figure 10. Targeted physical activity programming or scheduling that is operated by both municipalities and non-municipal groups, by municipality size (source: 2015 Physical Activity Opportunities in Canadian Communities survey, CFLRI).](image)

Parental Safety Concerns as a Barrier to Children’s Physical Activity

Children of parents who feel comfortable letting them actively travel to school within the neighbourhood are more likely to actively commute to school. Studies have also found that children are more physically active in general when parents perceive their neighbourhood to be safe. These concerns include stranger danger, bullies and teenagers, and traffic. However, as identified in the Position Statement on Active Outdoor Play, which was informed by two comprehensive systematic reviews, “access to active play in nature and outdoors – with its risks – is essential for healthy child development,” and the potential benefits far exceed the risk of harms. For example, most injuries associated with outdoor play are minor, and cases of stranger abduction or assault are extremely rare.

Environmental health risks may also be a parental concern that limits children’s physical activity. Due to their unique physiology, children are more susceptible to heat stress and heat stroke than adults are. Children also experience the negative impacts of air pollution at lower concentrations compared to adults. At younger ages, children lack the knowledge or ability to modify their behaviour to compensate for environmental conditions without adult intervention. Extreme heat, dehydration, fatigue and air pollution can limit cognitive ability, as well as increase aggression and irritability, and in extreme cases can result in illness. However, when parents take appropriate precautions – such as encouraging play in shaded areas and/or on natural surfaces (e.g., grass, dirt) and providing water to maintain hydration – these environmental health risks can be mitigated.
The Importance of the Natural Environment for Physical Activity

Particular elements of the natural environment are instrumental in affording the benefits associated with active outdoor play (see Active Play on page 20). For example, a recent study found that the physical activity levels of 11- to 13-year-olds was directly related to the amount of space devoted to trees in their home neighbourhood: each additional increase in the proportion of neighborhood land covered by treed areas was met with a corresponding increase in free-time physical activity outside of school hours. Interestingly, physical activity was not associated with other forms of green space including meadows, developed parks or playgrounds.188

In Europe, two different types of playgrounds were compared: a contemporary playground, consisting of fixed and mono-functional equipment such as a slide and seesaw, and a nature-based playground that included indigenous vegetation, natural water areas, movable equipment and equipment made of natural materials such as wood and ropes. Results revealed that 5- and 6-year-olds played for significantly longer episodes on the nature-based playground, and their play was more complex and diverse. Evidence also suggests that play spaces where natural elements are installed solely for decorative purposes, or where children are prevented from engaging with the material, do not afford the same benefits.66

Contributing Factors and Disparities

Local governments and communities represent the front line for facilities, and many programs and services.189 However, many local governments in rural communities face infrastructure challenges due to limited revenue and financial capacity.189 Northern and remote communities also face serious infrastructure challenges due to the high cost of living and limited construction season, among other factors.189 Although the majority of Canadians have reported access to facilities, programs, parks and playgrounds for many years,2 infrastructure and programming disparities exist in rural, northern and remote communities. For example, relatively fewer parents in the Northwest Territories and several of the Atlantic provinces report availability of public facilities, programs, parks and outdoor spaces compared to parents from other parts of Canada.190 These disparities require attention before the Community & Environment grade can see more improvement.
INDICATORS: Strategies & Investments

2015 federal government Ministerial Mandate letters call out priorities related to sport, recreation and physical activity for Ministers of Sport and Persons with a Disability, Infrastructure and Communities, and Environment and Climate Change.
This year’s grade was informed by a comprehensive data-gathering process to identify the best available evidence from government officials including the Public Health Agency of Canada, Sport Canada and provincial/territorial ministerial offices. The improved grade in 2015 was based primarily on promises or projected work that has now come to fruition. This year’s grade remains a B- due to the lack of new activity to warrant further improvements in the grade.

### BENCHMARK

- **A**: 81-100%
- **B**: 61-80%
- **C**: 41-60%
- **D**: 21-40%
- **F**: 0-20%

- **Evidence of leadership** and commitment in providing physical activity opportunities for all children and youth.
- **Allocated funds** and resources for the implementation of physical activity promotion strategies and initiatives for all children and youth.
- **Demonstrated progress** through the key stages of public policy making (i.e., policy agenda, policy formation, policy implementation, policy evaluation and decisions about the future).

* In years prior to 2010, there was one indicator: Federal Government Strategies & Investments. From 2010 to 2012, there were two separate indicators: Strategies and Investments. In 2013, these indicators were again collapsed into a single indicator.

** In years prior to 2010, there was one indicator: Provincial/Territorial Government Strategies & Investments. From 2010 to 2012, there were two separate indicators: Strategies and Investments. In 2013, these indicators were again collapsed into a single indicator.
Key Findings

- **With the introduction** of the new Liberal government in October 2015, Prime Minister Justin Trudeau issued Ministerial Mandate letters, many of which had specific call-outs to physical activity, sport and recreation sectors:

  - **Minister of Sport and Persons with Disabilities**: Promote healthier Canadians through sport and recreation, and ensure greater accessibility and opportunities for Canadians with disabilities.
  
  - **Minister of Infrastructure and Communities**: Make efforts to improve facilities and infrastructure for physical activity.
  
  - **Minister of Environment and Climate Change**: Develop Parks Canada programs and services so that more Canadians can experience our National Parks and learn more about our environment and heritage.

- **The Healthy Active Living and Obesity Research Group**, the Canadian Society for Exercise Physiology (CSEP), ParticipACTION, and the Conference Board of Canada, with support from the Public Health Agency of Canada, led the development of the **Canadian 24-Hour Movement Guidelines for Children and Youth: An Integration of Physical Activity, Sedentary Behaviour and Sleep**.

- **In 2015-16**, Sport Canada maintained its annual contributions of approximately $16 million toward increasing sport opportunities for children and youth.

- **Since 2013**, the Public Health Agency of Canada has leveraged over $34 million in non-governmental funding through its Multi-sectoral Partnerships Approach to increase the impact of federal programs aimed at increasing physical activity and other related health behaviours.

- **In its 2016 budget**, the federal government unveiled plans to end the Children’s Fitness Tax Credit, which has recently been criticized for providing unequal access to physical activity and sport participation by favouring those who can afford to register their children in sport. It is unclear at this time whether or not this investment is being redirected to support child and youth physical activity in another area.
**Provincial Spotlight**

**Northwest Territories** – Through the Recreation and Sport Contributions, financial assistance is provided to eligible recreation and sport organizations in the development and delivery of sport and recreation activities: [www.maca.gov.nt.ca/home/for-residents/sport-recreation/recreation-sport-contributions/](http://www.maca.gov.nt.ca/home/for-residents/sport-recreation/recreation-sport-contributions/).

**Alberta** – Continued support for the Alberta Healthy School Community Wellness Fund, the Communities ChooseWell initiative and Ever Active Schools.

**Saskatchewan** – Continues to invest in Saskatchewan in motion. Mind Exercise Nutrition Do It (MEND), and Healthy Start.

**Manitoba** – Held its first physical literacy conference: Gateway to Active Participation.

**Ontario** – Released the Trails Action Plan, which establishes priorities for a three-year period under the [Ontario Trails Strategy](http://www.maca.gov.nt.ca/home/for-residents/sport-recreation/recreation-sport-contributions/).

**Prince Edward Island** – Expanded the Provincial Active Start program to Boys and Girls Clubs: [www.sportpei.pe.ca/active_start](http://www.sportpei.pe.ca/active_start).

**New Brunswick** – Launched NB PLAYS! an after-school initiative for children and youth 5-19 years old.

**Nova Scotia** – Launched the [Shared Strategy for Advancing Recreation in Nova Scotia](http://www.recreations.ns.ca/advocacy/shared_strategy/).

**Government**

---

ParticipACTION Report Card on Physical Activity for Children and Youth
Research Gaps

- **Research is needed** to gain a better understanding of what is required in financial, human and program resources to reverse trends in physical activity and sedentary behaviour in Canadian children.

- **There is an ongoing need** to implement common tools and metrics for measuring all movement behaviours (physical activity, sedentary behaviour, and sleep) at the national level, and across each province and territory.

Recommendations

- **Invest in training** around understanding the importance of the natural and outdoor environment when it comes to play education.

- **Proceed with the recommendations** of Obesity in Canada: a Whole-of-Society Approach for a Healthier Canada (a report by the Standing Senate Committee on Social Affairs, Science and Technology), including the recommendation for the development and implementation of Active Canada 20/20.

- **Provide leadership development**, training, and community capacity building for those living in rural or remote communities, for new Canadians and marginalized populations.

- **Work with other organizations**, such as the Conference Board of Canada, to understand the investment required to increase physical activity in Canada.

- **Enhance capacity** and consistency in childcare settings and schools to provide opportunities to develop physical literacy, and to increase physical activity and decrease sedentary time.

Spotlights

**Canadian 24-Hour Movement Guidelines for Children and Youth: An Integration of Physical Activity, Sedentary Behaviour, and Sleep**

The **Healthy Active Living and Obesity Research Group**, the Canadian Society for Exercise Physiology, ParticipACTION and the Conference Board of Canada, with support from the Public Health Agency of Canada, led the development of the **Canadian 24-Hour Movement Guidelines for Children and Youth: An Integration of Physical Activity, Sedentary Behaviour, and Sleep**. These integrated guidelines harmonize recommendations for physical activity, sedentary behaviour and sleep, and represent the first time these behaviours have been integrated as a single recommendation. The initiative included updating existing and performing new systematic reviews in school-aged children and youth (aged 5-17 years) to examine the relationship between different intensities (light, moderate, vigorous) of objectively measured physical activity and important health indicators; developing the guidelines by following established protocols for clinical practice guideline development, and use of the evidence from systematic reviews, findings from national health survey analyses and input from the co-applicants including knowledge users and international collaborators; and developing and disseminating the guidelines and their evaluation. The Public Health Agency of Canada is invested $443,000 to support the development of the guidelines and leveraging over $700,000 from project partners.
Canada 150

To mark the 150th anniversary of Confederation in 2017, the federal government is funding a variety of activities and infrastructure. A $210-million Canada 150 Fund will create opportunities for Canadians to participate in local, regional and national celebrations that encourage participants to give back to Canada through gifts of time and energy, including sport and active-living activities and events. One initiative to be funded is the ParticipACTION 150 Play List, a high-impact large-scale project that will encourage all Canadians to get active and cement our national identity as a physically active culture. Also, the Canada 150 Community Infrastructure Program will invest $150 million over two years to support projects that rehabilitate existing community facilities across Canada, including parks, recreational trails such as fitness trails, arenas, pools, fields and recreation centres.

Sport Canada

According to the Minister of Sport and Persons with Disabilities Mandate Letter, the Minister’s overarching goal is to promote healthier Canadians through sport and recreation, and to ensure greater accessibility and opportunities for Canadians with disabilities. The Government of Canada contributed approximately $500 million for sport infrastructure, legacy initiatives, a federal cultural strategy, preparation of Canadian teams (athletes, coaches and officials), and essential federal services that supported the overall staging, safety and security of the Toronto 2015 Pan and Parapan Am Games. This includes the federal investment of up to $377.1 million in infrastructure and related projects.

In 2015-16, Sport Canada provided $3.4 million to the 2017 Canada Summer Games Host Society (of a total multi-year contribution of up to $10.35 million), for a combination of operations and capital (infrastructure). The overall capital contribution for these Games is up to $3 million, to be used for two competition venues. A similar $3 million capital contribution was provided to the Prince George 2015 Canada Winter Games Host Society.

In 2015-16, Sport Canada maintained its annual contributions of approximately $16 million toward increasing sport opportunities for children and youth through organizations such as ParticipACTION, Motivate Canada, PHE Canada, Canadian Tire Jumpstart, KidSport, The Grand défi Pierre Lavoie, the Canadian Paralympic Committee, Special Olympics Canada and the Canadian Deaf Sport Association.

Multi-Sectoral Partnerships

In February 2013, the Public Health Agency of Canada launched the Multi-sectoral Partnerships to Promote Healthy Living and Prevent Chronic Disease approach, with annual contributions of approximately $20 million to promote healthy living and address chronic disease through an integrated approach to addressing common risk factors, including physical inactivity. The Multi-sectoral Partnerships approach advances innovative solutions to public health challenges by providing the co-investment needed to test and/or scale up the most promising primary prevention interventions. This partnership will reach more than one million Canadians through existing projects and is working with more than 100 new partners including organizations such as RBC, ParticipACTION, Canadian Tire, Reebok Canada, the Canadian Football League, the Boys and Girls Clubs of Canada, Sunlife Financial, Social Change Rewards, The Heart & Stroke Foundation, The Running Room, the Canadian Cancer Society, Maple Leafs Sports and Entertainment, and many others.

See www.phac-aspc.gc.ca/fo-fc/mspphl-pppmvs-eng.php for a list of currently funded projects.
Between October 2014 and June 2015, the Standing Senate Committee on Social Affairs, Science and Technology held 22 meetings and heard from a broad range of experts on issues concerning obesity – specifically centred on diet, physical activity and best practices. In March 2016, the committee released *Obesity in Canada: a Whole-of-Society Approach for a Healthier Canada*, outlining causes, and recommendations to reduce the incidence of obesity in Canada. One of the causes that was outlined was overall lifestyle, including organized sport and exercise programs, active play and activities of daily living. As a way forward, the committee made a series of 21 recommendations, including five that were directly related to physical activity:

**Recommendation 5:** The committee further recommends that the federal government conduct assessments of the Children’s Fitness Tax Credit with a view to determining how fiscal measures could be used to help Canadians of lower socioeconomic status choose healthy lifestyle options.

**Recommendation 14:** The committee therefore recommends that the federal government increase funding to ParticipACTION to a level sufficient for the organization to:
- Proceed with Active Canada 20/20.
- Become the national voice for Canada’s physical activity messaging.

**Recommendation 15:** The committee further recommends that the Minister of Health and the Minister of Sport and Persons with Disabilities together use the recently established National Health and Fitness Day to promote the Canadian Physical Activity Guidelines.

**Recommendation 17:** The committee further recommends that the Minister of Health in discussion with provincial and territorial counterparts as well as non-governmental organizations already engaged in these initiatives:
- Encourage improved training for physicians regarding diet and physical activity;
- Promote the use of physician counselling, including the use of prescriptions for exercise;
- Bridge the gap between exercise professionals and the medical community by preparing and promoting qualified exercise professionals as a valuable part of the healthcare system and healthcare team;
- Address vulnerable populations, such as Canadians of lower socio-economic status including Canada’s Aboriginal population, and pregnant women;
- Advocate for childcare facility and school programs related to breakfast and lunch programs, improved physical education, physical activity and nutrition literacy courses; and,
- Engage provincial governments in discussions about infrastructure requirements for communities that encourage active transportation and active play.

**Recommendation 18:** The committee further recommends that the federal government provide funding under the New Building Canada Fund to communities for infrastructure that enables, facilitates and encourages an active lifestyle, both indoors and outdoors.

**Recommendation 21:** The committee further recommends that Health Canada and other relevant departments and agencies, together with existing expertise and trusted organizations, implement a comprehensive public awareness campaign on healthy active lifestyles.

For the committee’s full report, go to [www.parl.gc.ca/Content/SEN/Committee/421/soci/RMS/01mar16/Report-e.htm#recs](http://www.parl.gc.ca/Content/SEN/Committee/421/soci/RMS/01mar16/Report-e.htm#recs).
Non-Government

This year’s grade remains an A- because available data around leadership and commitment, allocation of funds, and policy work signal neither an upgrade nor downgrade of the indicator. This year’s grade was informed, in part, by a survey of ParticipACTION’s network partners including non-government, non-profit and for-profit organizations. This survey provides a comprehensive snapshot about what has happened in the physical activity, recreation and sport sector over the past year.

- **Evidence of leadership and commitment** in providing physical activity opportunities for all children and youth.

- **Allocation of funds and resources** for the implementation of physical activity promotion strategies and initiatives for all children and youth.

- **Demonstrated progress through the key stages of public policy making** (i.e., policy agenda, policy formation, policy implementation, policy evaluation and decisions about the future).

* In years prior to 2012, there was one indicator: Non-Government Strategies & Investments. In 2012, there were two separate indicators: Strategies and Investments. In 2013, these indicators were again collapsed into a single indicator.
Key Findings

- The majority of organizations surveyed said that their level of investment to increase physical activity among children and youth has increased, or stayed the same.

- A variety of non-governmental organizations – including Canadian Tire Jumpstart, KidSport, PHE Canada, Arctic Inspiration Prize Tri-Territorial Recreation Training Project, The Sandbox Project and Active for Life – focus on increasing sport and physical activity opportunities for children and youth across Canada.

Research Gaps

- There is a need to understand whether a focus on multi-sectoral partnerships takes away funding from smaller grassroots organizations and shifts resources to those that are able to find corporate funding.

- The effectiveness of programs implemented by private-sector organizations through multi-sectoral partnerships should be evaluated against those implemented by non-governmental organizations.

- Study is needed to understand the balance between providing funding for new start-up projects and providing long-term sustainability for established and effective long-term projects and programs.

- Research should be done on the behaviour change implications associated with longer-term, population-based programming versus single-day events, and identify areas to focus resources.

Recommendations

- Continue to work with corporate partners to leverage funding for new and existing research programs and promote intersectoral partnerships.

- Non-government organizations, including private and philanthropic organizations, should maintain or increase funding for healthy active living across Canada. With this, a model should be developed for “best practices” for public-private partnerships in the field of physical activity, sport and recreation.

- Work with governments to implement a pan-Canadian physical activity framework (e.g., Active Canada 20/20).

- Hold government accountable for policies that put up barriers to increase physical activity and decrease sedentary behaviour among children and youth.
Spotlight

KidSport

KidSport is a national not-for-profit organization that provides financial assistance for registration fees and equipment to kids aged 18 and under. KidSport is made up of a network across Canada including 11 provincial/territorial chapters and 178 community chapters. Since its creation in 1993, more than 530,000 kids across the country have been given the chance to play sport through KidSport grants and sport introduction programming. Their latest campaign generated over $85,000 to give children the gift of sport.

ParticipACTION Teen Challenge

The ParticipACTION Teen Challenge, sponsored by Coca-Cola Canada, is a national program that inspires and supports Canadian teens aged 13-19 to get active. Grants of up to $500 are available to organizations to fund physical activity programs specifically for teens. In 2015 over 750 organizations joined the ParticipACTION Teen Challenge and 799 teen physical activity grants were distributed. Since its launch in 2008, the ParticipACTION Teen Challenge has enabled 400,000 teens to get active in more than 5,000 organizations across Canada, and has deployed more than 4,000 grants totaling $5.5 million to the sector. Research confirmed that micro-grants of just $250-$500 offered through the ParticipACTION Teen Challenge can help reduce financial barriers and empower adolescents to take an active role in identifying and hosting new and creative physical activity events within their communities.

RBC Learn to Play

The RBC Learn to Play Project provides grants to local organizations and communities across Canada in support of building the physical literacy of children and youth in Canada. In 2015, RBC, in partnership with ParticipACTION, Sport for Life, and the Public Health Agency of Canada, provided over $2,040,000 in grants (ranging from $1,000 to $25,000) to organizations across multiple sectors. An additional $150,000 in grants was awarded to system change pilot initiatives. RBC Learn to Play Community Grants ($1,000 to $10,000) were awarded to local organizations that teach new skills or sports to kids, and/or expose them to multiple sports or multiple skills such as swimming or skating lessons. RBC Learn to Play Leadership Grants ($10,001 to $25,000) were awarded to community groups that are developing or implementing action plans to transform the way sport and physical activities are planned and delivered, such as programs that makes sports available for new immigrant youth.

Active Play Position Statement

The 2015 ParticipACTION Report Card also included the Position Statement on Active Outdoor Play. This was the first time a knowledge product had been embedded directly in the Report Card and, together, they generated significant community-level action and impact across Canada. In addition to growing awareness and discussion about the importance of risky outdoor play, we have seen many examples of success in increasing children’s opportunities for self-directed play outdoors in all settings. For example, in September 2015, a court in Saanich, BC, dismissed a suit against the municipality for a play structure injury (see Supreme Court of British Columbia Rules That Permitting Kids to Play Grounders is Not Negligence on page 23). In his decision, the judge cited the ParticipACTION Report Card and its rallying cry that “adults should get out of the way and let kids play,” as evidence of the importance of valuing long-term physical health and development as much as safety. Also, the Ottawa-Carleton District School Board is using the 2015 Report Card and position statement as part of the evidence base to support its Outdoor Forest and Nature School kindergarten program.
The Lawson Foundation

**The Lawson Foundation** launched its new Outdoor Play Strategy which included funding for the 2015 ParticipACTION Report Card and $2,290,000 for 14 community projects from diverse sectors undertaking a variety of approaches to supporting outdoor play. The projects will also work together as a cohort to share learning, and Social Research and Demonstration Corporation will lead an evaluation of the Strategy through a $230,000 grant (lawson.ca/outdoorplay). The Strategy includes five projects focused on developing community action models, seven to build practitioner capacity, and two to develop public policy tools. Examples of projects include:

- **KidActive ($75,000)** – This national project supports the ongoing efforts of the Canadian Outdoor Play Working Group. The project includes an environmental scan and network mapping initiative, the development of key messages about outdoor play, knowledge sharing and translation tools, and a Speaker’s Fund to continue dissemination of the Position Statement on Active Outdoor Play.
- **Child and Nature Alliance of Canada ($225,000)** – The national Forest School Canada program supports professional learning from coast to coast to early childhood educators and elementary school teachers through the Forest and Nature School Practitioners’ Course. The course dives into the pedagogy of play-based and emergent curriculum in nature, as well as the practical components of delivering Forest and Nature School in a variety of education settings.
- **Canadian Public Health Association ($210,000)** – This national project investigates the causes of risk aversion from a social and liability perspective and aims to develop a toolkit of policy options to address those concerns – from large cities to small rural areas. The project will be developed in collaboration with a wide range of partners from across Canada.

**Build Our Kids Success (BOKS)**

**The Public Health Agency of Canada** continues to support the Build Our Kids Success (BOKS) project in collaboration with its project partners the Canadian Football League (CFL), Reebok Canada and the University of Waterloo’s Propel Centre for Population Health Impact. BOKS is a before-school program for elementary school children, aimed at optimizing children’s physical and mental health as well as their confidence, well-being and readiness to learn. The program is based on a standardized, 12-week, functional, fun-based fitness curriculum. The aim is to roll it out across all nine CFL team cities by 2019, where it is expected to reach approximately 45,000 elementary school children in 450 schools across the country. The Public Health Agency of Canada has also invested significantly in the evaluation of the program by partnering with the University of Waterloo’s Propel Centre, and is collaborating with US-based evaluators for the BOKS program, based in the National Institute for Out of School Time, who are conducting a BOKS longitudinal evaluation.

**Boys and Girls Clubs of Canada – Get BUSY**

**The Boys and Girls Club of Canada**, in partnership with Sun Life Financial ($300,000) and the Public Health Agency of Canada ($325,964), implemented the Get BUSY program. This youth leadership program provides a range of physical activity opportunities (e.g., rock climbing, yoga) and promotes healthy eating choices (e.g., nutritious cooking classes) among children and youth. The program will also identify and plan opportunities to create healthier and more active Club environments and communities (e.g., increasing active transportation to the Clubs) in participating locations. The Get BUSY program is in 22 communities across Canada.

**The Play Exchange, Canada’s Active Living Challenge**

**LIFT Philanthropy Partners**, in partnership with Canadian Tire and the Public Health Agency of Canada ($826,460) developed the Play Exchange, Canada’s Active Living Challenge, to be delivered and launched in collaboration with project partners and the agency. The Challenge was a high-profile competition to seek out previously untested healthy living ideas from a host of divergent, non-traditional sectors. The competition solicited innovative project concepts to support healthy living interventions for Canadians. These project concepts focused on integrated approaches that promote healthy living, prevent chronic disease and address common chronic disease risk factors. The winner of the Challenge was Trottibus, a pedestrian bus service that gives elementary school children the chance to walk to school every weekday morning safely under adult supervision and to have fun at the same time. (See page 27 for more information about the Trottibus initiative.)

Methodology & Data Sources

Unlike other report card publications, which often rely on a single data source, the ParticipACTION Report Card synthesizes data from multiple data sources and the research literature. The development of indicators and the assignment of grades involve an interdisciplinary Report Card Research Committee, including researchers from across Canada. An annual summary of research data and literature is prepared by staff at the Children’s Hospital of Eastern Ontario Research Institute to facilitate the review of the information. Grade assignments are determined based on examination of the current data and literature for each indicator against a benchmark or optimal scenario, assessing the indicator to be poor, adequate, good or excellent:

- **A** = We are succeeding with a large majority of children and youth.
- **B** = We are succeeding with well over half of children and youth.
- **C** = We are succeeding with about half of children and youth.
- **D** = We are succeeding with less than half, but some, children and youth.
- **F** = We are succeeding with very few children and youth.

Key considerations include trends over time and the presence of disparities. Analysis of trends over time and international comparisons are conducted where possible, as this information is not always available for all indicators. National data take precedence over sub-national and regional data, and objectively measured data take precedence over subjectively measured data. Disparities are primarily based on disabilities, race/ethnicity, immigration status, geography (provincial/territorial comparisons), socioeconomic status, urban/rural setting, gender and age (e.g., adolescence). When evidence of disparities exists, grades are lowered to reflect that we are not reaching all children and youth who may benefit most from physical activity opportunities.

Some indicators are stand-alone, while others are comprised of several components. During the grade assignment meeting, each component of an indicator is assessed. Over the evolution of the Report Card, there has been an attempt to move toward indicators that are broad enough to contain various components in their assessment, so that indicators can become more consistent from year to year.

The following are major data sources used in the 2016 Report Card:

1. **Canadian Health Measures Survey (CHMS)**: The Canadian Health Measures Survey, launched in 2007, is collecting key information relevant to the health of Canadians by means of direct physical measurements such as blood pressure, height, weight and physical fitness. As part of the CHMS, a clinical oral health examination helps to evaluate the association of oral health with major health concerns such as diabetes, and respiratory and cardiovascular diseases. In addition, the survey is collecting blood and urine samples to test for chronic and infectious diseases, as well as nutrition and environment markers. Through household interviews, the CHMS is gathering information related to nutrition, smoking habits, alcohol use, medical history, current health status, sexual behaviour, lifestyle and physical activity, the environment and housing characteristics, as well as demographic and socioeconomic variables.

2. **Canadian Physical Activity Levels Among Youth Survey (CanPLAY)**: The Canadian Fitness and Lifestyle Research Institute conducts a major national survey annually to examine physical activity levels of children and youth. CANPLAY studies the current fitness and physical activity patterns of young people in Canada. Approximately 10,000 children and youth (approximately 6,000 families) are randomly selected across Canada. The study has been conducted since 2005. Pedometers are used to measure the number of steps taken daily by each participant. CANPLAY is a joint venture of the Canadian Fitness and Lifestyle Research Institute and the Interprovincial Sport and Recreation Council.

3. **Canadian Student Tobacco, Alcohol and Drugs Survey (CSTADS)**: Formerly known as the Youth Smoking Survey, CSTADS is a repeated, biannual, cross-sectional survey of 50,000+ students in grades 6 to 12 from all provinces except New Brunswick. Funded by Health Canada, the CSTADS was created to study the factors that increase or diminish the likelihood of tobacco use among youth. The Propel Centre for Population Health Impact at the University of Waterloo coordinates the implementation of the CSTADS nationally, and provincial partners implement the CSTADS in each province. The CSTADS was first administered in 1994 and it has been the largest and most comprehensive survey on youth smoking behaviour since 1979. It was repeated in 2002, 2004-05, 2006-07, 2008-09, 2010-11 and most recently in 2012-13.

4. **Health Behaviour in School-Aged Children Survey (HBSC)**: Results are based on the Canadian data from the World Health Organization’s 2009-10 HBSC. The HBSC is a repeated cross-sectional survey conducted every four years. The survey consists of a classroom-based questionnaire. The sample was designed according to the international HBSC protocol in that a cluster design was used, with the school class being the basic cluster and the distribution of the students reflected in the distribution of Canadians in grades 6 to 10 (ages 10 to 16). Canadian schools were selected for this study using a weighted probability technique to ensure that the sample is representative of regional geography and key demographic features such as religion, community size, school size and language of instruction. Schools from each province and territory, as well as urban and rural locations, are represented. A total of 26,078 youth from 436 schools across the country participated in the 2009-10 HBSC survey. The Canadian HBSC was approved by the Queen’s University General Research Ethics Board. Consent was obtained from the participating school boards, individual schools, parents and students. Student participation is voluntary. The HBSC includes three main components: 1) a questionnaire completed by students that asks about their health behaviours (such as physical activity and active transportation), lifestyle factors and demographics; 2) an administrator questionnaire distributed to each school principal that inquires about school demographics, policy, infrastructure and the school neighbourhood setting (completed for 411 of the 436 participating schools); and 3) geographic information systems (GIS) measures of built and social features in the school neighbourhoods.

5. **Opportunities for Physical Activity at School Survey (OPASS)**: The content of the 2015 OPASS is designed to explore the availability and composition of physical education programming at school, determine the availability and adequacy of facilities and opportunities for physical activity, explore the provision of extracurricular physical activities, examine policies related to physical activity at school, and describe the broader physical and social environments at school. The survey consists of a self-completed questionnaire that inquired about sports, physical activity, and lifestyle factors in schools. Consensus was obtained from the participating school boards, individual schools, Parents and students. Student participation is voluntary. The OPASS includes three main components: 1) a questionnaire completed by students that asks about their health behaviours (such as physical activity and active transportation), lifestyle factors and demographics; 2) an administrator questionnaire distributed to each school principal that inquires about school demographics, policy, infrastructure and the school neighbourhood setting (completed for 382 of the 436 participating schools); and 3) geographic information systems (GIS) measures of built and social features in the school neighbourhoods.

6. **Physical Activity Monitor (PAM)**: The PAM is a telephone survey conducted by the CFLRI that tracks changes in physical activity patterns, factors influencing participation, and life circumstances in Canada. As such, it tracks outcome indicators of the effects to increase physical activity among Canadians. To date, 17 waves of PAM have been completed, with theme content cycled in and out across planned periods.
