Methodology and Detailed Findings
The detailed methodology and detailed findings of this report card (data and references etc.) are available on our website (www.activekids.jp). An academic publication based on the 2016 Japan Report Card on Physical Activity for Children and Youth is published in the Journal of Physical Activity and Health.

Next Steps
This is the first version of the Japan Report Card on Physical Activity for Children and Youth. We are planning to publish it subsequently to monitor changes to each grade, in 2018, and after the Tokyo 2020 Olympic and Paralympic Games. To do so, we need further funding and are seeking partnerships with individuals or organizations who might consider providing financial or other support. Please contact the Active Healthy Kids Japan Group (info@activekids.jp) for further information.

Acknowledgements
This card was produced with funding from the project research of Japanese Society of Physical Fitness and Sports Medicine in 2015 (2015-2017). Chiaki Tanaka, Shigeru Inoue, Motohiko Miyachi, Koya Suzuki, Takafumi Abe: Physical Education and Medical Research Center UNINAN (Shigeho Tanaka), J. F. Oberlin University, Juntendo University, and was a partnership between J. F. Oberlin University (Dr. Chiaki Tanaka), the National Institutes of Biomedical Innovation, Health and Nutrition (Dr. Shigeho Tanaka, Dr. Motohiko Miyachi), Tokyo Medical University (Prof. Shigeho Inoue), and Juntendo University (Dr. Koya Suzuki), and the University of Strathclyde (Prof. John J Reilly). We are grateful for the contributions of members of the project steering group and stakeholders who formed a wider working group, especially the members of the Japan Society of Human Growth and Development.

The Cover of the 2016 Japan Report Card
A stated aim of physical education (PE) of the national educational curriculum guideline is to improve physical fitness and to promote a positive attitude toward exercise as a lifelong physical activity. However, as the cover of the 2016 Japan Report Card suggests, students don’t move continuously during PE class, because they have to sit or stand during their teacher’s instruction and/or while waiting their turn. It is also worth noting that a recent systematic review of the moderate-vigorous physical activity (MVPA) content of school PE globally suggested that a minority of time in PE classes was spent in MVPA (Hollosi et al. 2016).

The grades illustrate the state of physical activity in Japanese children and adolescents. The report card can be utilized as information to support policy development in physical activity for children and adolescents, families, schools, local communities and the country as a whole.
Physical Activity, Health Behaviours and Outcomes

1 Overall Physical Activity Levels

There are no representative Japanese data for physical activity in under 15-year-olds. The National Health and Nutrition Examination Survey reported step counts for 15-19 year olds. In males, the data showed a marked decrease for several years. On the other hand, the trend in females generally continues to be flat. However, data haven’t been reported since 2012.

2 Organized Sport Participation

Participation in sport was reported for 27-92% of 6- to 17-year-olds by the Report of Survey on Physical Strength and Athletic Performance of Japan Sports Agency (2015). The prevalence at 4-5 years old was reported at 29% in 2015 according to the Saskatchewan sports foundation (SSF) National Sports-Life Survey of Children.

3 Active Play

There are no representative Japanese data for active and outdoor play. There are no Japanese government recommendations for active and outdoor play.

4 Active Transportation

The 2015 SSF National Sports-Life Survey of Children reported that 28% of Japanese preschool children (4-5 years old) regularly commuted actively (walking) to school. The 2015 SSF National Sports-Life Survey of Young People reported that 93% of Japanese elementary school children (6-11 years old) regularly commuted actively (walking or cycling) to school, and 88% of junior high school students (12-14 years old) and 68% of high school students (15-17 years old) regularly commuted actively.

5 Sedentary Behaviours

The Report of National Survey on Physical Fitness, Athletic Performance and Exercise Habits of the Japan Sports Agency (2015) reported that 71-76% of grade 5 Japanese primary school children and second year in junior high school children spent more than 1 hour per day of watching TV, videos or DVDs viewing (Not playing video games). In addition, 30-60% reported 1 hour per day playing video games (PCs, portable electronic devices having a game function, cellular or smart phones). The 2015 SSF National Sports-Life Survey of Young People reported that 31% of Japanese preschool children (4-5 years old) spent more than 2 hour per day of screen time (watching TV, PCs etc.).

6 Physical Fitness

The Report of Survey on Physical Strength and Athletic Performance of the Japan Sports Agency (2015) comprehensively evaluated physical fitness by 5 gender- and age-specific ranks (A-E). The percentage of A and B rank among Japanese 6- to 17-year-olds was 42-67%. The physical fitness test data suggest that currently physical fitness levels in children and adolescents are lower than that in the 1980s.

7 Weight Status

The School Health Survey data (2015) by the Ministry of Education, Culture, Sports, Science and Technology (MEXT) reported that 2.24-11.34% of 5-17 year old Japanese boys and girls were obese. Overall, however, the levels are high compared to the 1980s. On the other hand, the percentage of underweight children was 0.40-4.33%.

Settings and Influences on Physical Activity and Health

8 Family and Peer Influence

The National Health and National Survey (2014) reported that daily step counts were 7,860 for males aged 20 to 64 years old, and 6,794 for females, respectively. The prevalence of obesity in Japanese adults was 23% in males and 21% in females which is based on over 25kg/m² of BMI (body mass index). Participation in sport twice or more a week, 30min or more per time over 1 year was reported by 31% of males and 25% of females. In grade 5 Japanese primary school students and second year junior high school students, the percentage of participation in sport or exercise with a guardian more than once per week was 7-36% by the Report of Survey on Physical Strength and Athletic Performance of Japan Sports Agency (2015). The 2015 SSF National Sports-Life Survey of Young People reported that 72% of Japanese preschool children (4-5 years old) participated in exercise or sport with their parent “often” or “sometimes”.

9 School

The MEXT sets the educational curriculum guidelines for all primary and secondary schools including the content of physical education, the number of physical education classes, and guidelines for school infrastructure and equipment ministry. The guidelines for nursery schools and centers for early childhood education and care are set by the Ministry of Health, Labour and Welfare and the Cabinet Office. Those guidelines require physical activity during childcare for young children. However, physical education in primary schools or active play in nursery schools or kindergartens isn’t carried out by specialist course teachers who have studied physical education. Also, in primary schools, physical education classes are the only classes that don’t use textbooks.

10 Community and the Built Environment

Health Japan 21 (second term) by the Ministry of Health, Labour and Welfare reported that the number of local governments which addressed the need to improve physical environment where residents can easily exercise and be physically active stood at 17/47 prefectures (2012). The 2015 SSF National Sports-Life Survey of Young People reported that 48% of Japanese parents of 4-9 year old children agreed they lived in neighborhoods that allow children to engage into active outdoor play, exercise, or participate in organized sports.

11 Government Strategies and Investments

There are many relevant laws and ordinances such as The Basic Act on Sport, the Health Promotion Law, the Basic Act on Food Education, and so on. There are also strategies and policies in place like the Sport Basic Plan, Health Japan 21 (second term), and so on. Physical activity guidelines are for preschool children, adults, and the elderly. However, national physical activity guidelines for children and adolescents (6-17 years) are not established.
